Course description					
During a course the finite difference method applied to solving partial differential equations is presented, the finite element method, its implicit as well as explicit approaches, are presented as well. An introduction is given to solving coupled problems, where Fluid-Structure Interaction, as an example, shows one of an engineering problem that is being solved today. Many problems involved today the contact problems: techniques used in solving such problems are introduced during a course as well. Buckling and post-buckling analysis are given also. The basics of the Computational Fluid Dynamic is introduced.
