 Knowledge of the modern systems to measure nonelectrical quantities, including the quantities to be measured in biophysical investigations. Knowledge of the modern techniques of the acquisition, processing and presentation of measurement data. Study outcomes and reference to the educational results for a field of study Knowledge: Ability to characterize the importance and application possibilities of the modern measuring systems [K_W05 +, K_W14 +] Ability to explain the principles and techniques of the measuring signals acquisition for applications in industry and biomedical engineering [K_W03 +] Skills: Ability to work independently and as a team in the design and construction companies, research laboratories, industrial centres, and medical facilities - [K_U05 +, K_U23 ++] Social competencies: Ability to think and act interprisingly in the area of measuring systems to be used in industry and biomedical engineering - [K_K01 +] Understanding the necessity of broad popularization of the knowledge in the scope of simple and complex measuring 	- Konw	ledge of interdisciplina	ary achievements in the area of a	pplic	ation of sensors and meas	urinę	g systems in industry,		
Study outcomes and reference to the educational results for a field of study Knowledge: 1. Assessment methods of study outcomes

Lectures:

- evaluation of the knowledge with a written exam related to the content of lectures (test, computational and problem questions), awarding marks in laboratory exercises)

- continuous estimation in all classes (awarding attendance in lectures, activity and quality of perception).

Laboratory exercises:

- continuous estimating with the tests,

- awarding the skill increase,

- the evaluation of knowledge and skills connected with the measuring tasks and prepared reports

Course description

Updating 2017:

Methods of education are orientated to students to motivate them to participate actively in education process by discussion and reports.

Lectures:

Multimedia presentations expanded by examples shown on a board. Activity of students is taken into consideration in final students evaluation. Theoretical questions are presented in the exact reference to the practice.

Laboratory:

Detailed reviewing of particular exercises reports. Realization of laboratory tasks in teams, taking into account the specific computational experiments covering:

- Measuring transducer with electrical output signal basic statical and dynamical properties.
- Measurement of electrical signals.
- Standard analog signals.
- Power supply of measuring transducers.
- Attenuation of electromagnetic disturbances.
- Determination of the coefficient of the processing of the transducer.
- Bridge sternal Measurement of the resistance by the use of a bridge circuit.
- Thermography.
- Laser and ultrasonic sensor of the distance.
- Examples of measuring transducers.

- Metrological attributes and testing of the selected equipment for measurements and recording used in physical and biophysical applications.

- Modern methods of imaging used in technology and medicine: thermovision, thermography, ultrasonography, computer tomography (CT), magnetic resonance (MRI), X-ray imaging (RTG), fiberoscopy and endoscopy.

- Devices for acquiring images with visible radiation (CMOS and CCD cameras).

- Configuration of vision systems for image acquisition with analog and digital cameras.
- Selecting the camera optical systems.
- Formats of graphical files and methods of data compression.
- Methods of image digital processing.
