Assessment methods of study outcomes

- Forming evaluation:

a) in terms of the lecture: based on the answers to questions about the material discussed in previous lectures,

b) in the scope of the laboratory: based on the assessment of the current progress of laboratory tasks.

- Summary rating:

a) in the scope of the lecture: on the basis of a test of theoretical knowledge from the lecture material,

b) in the scope of the laboratory: based on the assessment of completed laboratory tasks and prepared reports.

Course description

The concept of automation, automatic control system (URA), exemplary systems, elements and classification of URA, technological process monitoring tools, SCADA systems. Regulators: regulator tasks, types and properties of regulators, two and three-point controllers, PID continuous controllers, selection of controllers' settings by selected techniques. Basic concepts of robotics, types and general construction of robots, tasks of industrial robots, coordinate systems, location representation, manipulator kinematics, systems and programming languages ??of manipulators on the example of robots KUKA and Staubla. Construction and operation of programmable logic PLC controllers, controller operation cycle, controller input and output systems, programming languages, basics of programming in ladder language. Construction and operating principle of selected sensors and measuring devices used in automation and robotics.

Teaching methods:

Lecture - informative and conversational lecture

Laboratory - laboratory method
