Lecturers

Responsible for the course/lecturer:

Responsible for the course/lecturer:

Marian Liskowski, Ph.D.

e-mail: marian.liskowski@put.poznan.pl

Poznan University of Technology

Faculty of Control, Robotics and Electrical

Engineering

Prerequisites

Knowledge of mathematics at the first-cycle studies.

Course objective

To familiarize students with the basic methods of descriptive statistics. Acquiring the ability to perform simple statistical analyzes.

Course-related learning outcomes

Knowledge

- student knows selected methods and tools of descriptive statistics that can be used in engineering practice,
- student knows the rules of preparing and conducting scientific research, is able to interpret the results of calculations and draw conclusions on the structure of the surveyed population and correlation features (phenomena).

Skills

- student is able to correctly select the sources and information derived from them, assess them, critically analyze and synthesize the information obtained, formulate conclusions and comprehensively justify the solutions adopted,
- student is able to apply methods and tools of descriptive statistics in engineering practice,
- student is able to apply index methods and methods of time series decomposition to dynamics analysis.

Social competences

- student is aware of the occurrence of cause-effect relationships relevant during the implementation of the objectives. He can rank the importance of alternative solutions,
- student is aware of the usefulness of mathematical competence in engineering practice.

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Lecture:

- a test consisting of 10 questions. Passing threshold: 60% correct answers.

Tutorials:

- the ability to perform simple statistical analyzes is tested (written work). Passing threshold: 55% of the points limit,
- verification of skills during classes.

Programme content

Preliminaries (populations, observations and samples, statistical characteristics and their classification, measure scales). Statistical research stages (aim, subject and space of statistical research, statistical observations and samples, statistical series and their types, statistical tables, graphical presentation of observation results). Numerical characteristics of the structure: measures of central tendency, measures of dispersion, measures of skewness, measures of concentrations. Measures of correlation for two variables (correlation series, correlation diagram, correlation table, covariance, Pearson's correlation coefficient, Spearman's rank correlation coefficients). Regression analysis (linear regression model). Analysis of growth dynamics (time series, absolute increase, relative increase, fixed base index, chain index, aggregative index). Decomposition of the time series: trend, seasonality and cycles, random fluctuations. Estimate of degree of adjusting of linear trend model for empirical data. Prediction based on linear regression model (absolute and relative prediction error).

Teaching methods

Lecture:

lecture conducted in an interactive way with the formulation of questions to students.

Tutorials:

- solving example tasks on the board,
- detailed review of task solutions,
- initiate discussion on solutions.

Bibliography

Basic

Breakdown of average student's workload

| | Hours | ECTS |
|--|-------|------|
| Total workload | 80 | 4,0 |
| Classes requiring direct contact with the teacher | 30 | 1,5 |
| Student's own work (literature studies, preparation for tutorials, preparation for tests) ¹ | 50 | 2,5 |

¹ delete or add other activities as appropriate
