

COURSE DESCRIPTION CARD - SYLLABUS

Course name

Civil Engineering 1

	Course
Field of study	Year/Semester
Architecture	I / 2
Area of study (specialization)	Profile of study
Architecture	general academic
Level of study	Course offered in
First-cycle studies	English
Form of study	Requirements
full-time	compulsory

		Number of hours
Lecture	Laboratory classes	Other (e.g. online)
30	0	0
Tutorials	Projects/seminars	
0	0	
Number of credit points		
2		

Lecturers	
Responsible for the course/lecturer: dr inż. arch. Adam Sieniecki	Responsible for the course/lecturer: mgr inż. arch. Jędrzej Suhecki
e-mail: adam.sieniecki@put.poznan.pl	e-mail: jedrzej.suhecki@put.poznan.pl
Wydział Architektury Politechniki Poznańskiej ul. Jacka Rychlewskiego 2, 61-131 Poznań	Wydział Architektury Politechniki Poznańskiej ul. Jacka Rychlewskiego 2, 61-131 Poznań

Prerequisites
The student should have basic knowledge of the mathematics, physics, basics of architectural design (fundamentals of architectural design), basic technologies and materials used in construction (materials).

Course objective

- Learning about the components of buildings, the functioning of the building structure as a whole;
- getting acquainted with loads occurring in the building, load differentiation depending on purpose of the object;
- providing basic information about "invisible" elements of the building influence of ground and water conditions on the whole design process;
- getting to know with variety of ceilings structures and possibilities of their forming,
- providing basic information about other horizontal elements and their purpose in buildings;

- presentation of vertical partitions and vertical load-bearing elements of buildings, and verticality transmission of loads;
- acquainting with the variety of wooden roof constructions, and possibilities of their use not only in housing construction;
- providing knowledge allowing for proper design of flat roofs;
- acquaintance with elements of insulation occurring in buildings, and with requirements in this respect concerning not only anti-moisture and anti-water insulation, but also sound insulation;
- Introduction of basic information about communication elements in buildings;
- providing knowledge about prefabrication, including that "coming back" to housing construction;

Course-related learning outcomes

Knowledge

B.W4. mathematics, space geometry, statics, material strength, shaping, construction and dimensioning of structures, to the extent necessary to formulate and solve tasks in the field of architectural and urban design;

B.W5. issues of construction, construction technologies and installations, construction and building physics, covering key issues in architectural, urban and planning design as well as issues related to fire protection of buildings;

B.W6. investment economics and organization methods as well as the course of the design and investment process; basic principles of design and implementation quality management in the construction process;

B.W9. principles of occupational health and safety.

Skills

B.U4. develop solutions for individual building systems and elements in terms of technology, construction and materials;

B.U5. make a preliminary economic analysis of planned engineering activities;

B.U6. properly apply standards and legal regulations in the field of architectural and urban design.

Social competences

B.S2. reliable self-assessment, formulating constructive criticism regarding architectural and urban planning activities.

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

A prerequisite for passing is obtaining a positive mark from the final test consisting of 15-23 questions. To pass the course the student is required to achieve at least 60% of the 100% possible points. The colloquium is given in the last lecture of the semester.

Summative Evaluation: - grading scale adopted: 2,0; 3,0; 3,5; 4,0; 4,5; 5,0.

Successful completion of the module depends on the student's achievement of all learning outcomes specified in the syllabus.

Programme content

Lecture #1: Introductory Lecture. presentation of the course program, credit requirements, discussion of what is general construction on the basis of projects and realization of selected buildings. Basic definitions of the subject (construction, buildings, structures).

Lecture #2 and #3: Components and building parts. Discussion of the basic building components (foundations, load-bearing walls, curtain walls, lintels, binders, columns, ceilings, trusses), Structural systems (longitudinal, transverse, mixed, unidirectional, bidirectional), construction types (with load-bearing walls, frame, cantilever, hanging, etc.), typification in construction - giving basic modular spans for individual structural elements - with particular reference to the structural and clear dimensions.

Lecture #4: Loads in building. Discussion of basic load standards i.e. permanent loads, basic process and installation (variable) loads, wind load and snow load with particular reference to variable loads depending on the function of the building. Discussion of basic design concepts, design stages, preliminary selection of structural system, materials, selection of floors. Design example for preliminary ceiling selection.

Lecture #5: Building foundations. Discussion of foundation methods - Direct foundations and indirect foundations, discussion of types of foundations for buildings (footings, grates, piles, slabs, slurry walls), materials, construction technology, and general principles of using particular types of foundations, discussion of basic information on soil-water investigations and hydrogeological conditions.

Lecture #6 and #7: Horizontal elements of buildings - part I "Floors". Discuss the function of floors in a building. Ceilings division due to division of floors depending on used materials: reinforced concrete, reinforced concrete and steel, ceramic and steel, wooden. Division of ceilings according to the technology of execution: prefabricated, semi-prefabricated, dense rib, monolithic (including mushroom and mushroomless ceilings). Basic floor construction systems: single and multi-span, one-way and two-way. Advantages and disadvantages of each solution. Discuss conditions affecting selection of a particular solution and floor thickness.

Lecture #8: Horizontal elements of buildings - part II "other horizontal elements". Discussion of other horizontal building elements: lintels (monolithic, prefabricated), beams (reinforced concrete and steel), balconies and terraces (construction, application possibilities, construction requirements), frames and frame systems, trusses. Provide rules for initial sizing of individual components, presentation of non-standard structural solutions such as Vierendeel beam, "hanging" ceiling. The functions of the various elements in the building.

Lecture #9: Vertical elements of buildings. Discuss the function of walls in a building, walls (load bearing, curtain, partition, foundations), discussion of the role in buildings, discussion of wall technology and materials of which walls are made. Criteria for selection of technology, material and size (load capacity, load distribution load, service conditions - acoustic and thermal insulation), columns - types of columns,

due to material used, scheme, shape - wooden, masonry, reinforced concrete, steel columns. Inter-window pillars - basic requirements. Pilasters. Technology of walls constructing (masonry on mortar, glued, prefabricated, monolithic). Layered wall systems of lightweight housing.

Lecture #10: Roofs - wooden roof structures. Discussion of wooden roof structures - rafter, rafter and purlin, collar beam, hipped, mansard. Components of each structure along with basic dimensions. Conditions of application of different types of trusses, materials used for roof structures. Ways of joining wooden structures - carpentry joints, nail and screw joints, steel fasteners. Types of roofing used in roof trusses. Structural elements made of glued laminated timber.

Lecture #11: Flat roofs and roof coverings. Presentation of solid and ventilated - hatch and non-hatch - roof structures, materials used to design flat roofs and flat roof coverings (minimal decreases). Steel roof structures - trusses and sheet metal trusses. Metal flashings on roofs.

Lecture #12: Insulation in buildings. Waterproofing, damp proofing, thermal and acoustic insulation - types, design, application. Details of the design and execution of insulation with particular taking into account typical "dangerous" places in buildings.

Lecture #13: Communication elements in buildings. Stairs, ramps, cranes, escalators, entrances and driveways to buildings. Division of communication elements by materials used. Types of communication elements, construction, structural requirements of applications of selected communication elements. Design - basic patterns ("comfortable stairs"), taking basic dimensions of communication elements.

Lecture #14: Repetition of the material.

Lecture #15: Credit Colloquium. Credit for the semester.

Teaching methods

- Lectures,
- Lecture with multimedia presentation,
- Lecture with slideshows of photos from construction projects,
- eLearning Moodle (a system for supporting the teaching process and distance learning).
