

## COURSE DESCRIPTION CARD - SYLLABUS

Course name

Selected aspects of distribution network's operation

### Course

Field of study

Electrical Engineering

Area of study (specialization)

Networks and Power System Protection

Level of study

Second-cycle studies

Form of study

full-time

Year/Semester

2/3

Profile of study

general academic

Course offered in

Polish

Requirements

elective

### Number of hours

Lecture

15

Laboratory classes

15

Other (e.g. online)

0

Tutorials

0

Projects/seminars

0

### Number of credit points

3

### Lecturers

Responsible for the course/lecturer:

mgr inż. Agnieszka Weychan

email: agnieszka.weychan@put.poznan.pl

tel. 61 665 2392

Faculty of Environmental Engineering and

Energy

Piotrowo 3A, 60-965 Poznań

Responsible for the course/lecturer:

dr hab. inż. Jarosław Gielniak

email: jaroslaw.gielniak@put.poznan.pl

tel. 61 665 2024

Faculty of Environmental Engineering and

Energy

Piotrowo 3A, 60-965 Poznań

### Prerequisites

Knowledge in electrical engineering, electrical power engineering and operation of power grids. Ability to calculate load flows, short-circuit currents and select power network's elements. Awareness of the need to extend professional, personal and social competences and continuous training, willingness to assess the knowledge critically and its importance in solving analytical and practical problems.

### Course objective

Understanding the principles of appropriately providing electricity distribution services and network operation, as well as acquiring the ability to assess the phenomena disrupting the reliability and quality of electricity supply to the final consumers and preventing such phenomena. Familiarizing with modern technologies and current problems related to the operation of electrical networks.

## Course-related learning outcomes

### Knowledge

1. Student has extensive knowledge on modelling power grids and systems, including reliability and quality of electricity supply and customer services.
2. Student has structured knowledge in the field of disturbances in power networks, management of power supply and consumption and principles of energy transmission in power grids.
3. Student knows the terms and conditions for electricity distribution, including economic and ecological aspects.

### Skills

1. Student can perform simulations of load flows and disturbances in a modelled power network using dedicated software (e.g. DigSILENT PowerFactory).
2. Student is able to use presented mathematical methods and models, modifying them accordingly if necessary, to analyze specific phenomena in power distribution systems.

### Social competences

1. Student is aware of the need to extend knowledge on distribution systems with the latest scientific and technological achievements and legal regulations.

## Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

### Lecture:

- determining knowledge and ability to assess significant factors affecting the quality of processes implemented in the area of electricity distribution based on a study performed individually on a selected relevant issue to distribution systems' operation,
- continuous assessment of student's skills and competences during each class (rewarding attendance and active participation in the classes).

### Laboratory:

- evaluation of knowledge and skills concerning the implementation on computer simulation tasks related to electricity distribution,
- assessment of reports on performed computer simulations,
- assessment of knowledge and skills acquired in class by written test.

## Programme content

### Lecture:

Obligations of distribution system operators and electricity suppliers in the process of electricity distribution based on the Energy Law and ordinances resulting from the act. The issue of safety of electricity supply in the aspect of system resources' adequacy and reliability of electricity supply from power grid. Obligations of network operators in the area of connecting renewable energy sources and providing services for renewable energy sources operators. Improving energy efficiency in electricity

distribution process by losses' reduction at network elements and compensating the reactive power flow, planning the distribution network's development, disturbances in the distribution networks caused by current and voltage harmonic distortions and prevention of such problems.

Laboratory:

Modelling and simulations of selected issues related to power grids using dedicated software (e.g. DigSILENT PowerFactory) - reliability of electricity supply, connecting renewable energy sources to the power grid, reduction of energy losses, planning the development of distribution networks, disruption in the power grid operation.

### Teaching methods

Lecture: multimedia presentation - informational and problem lectures

Laboratory: tasks related to modelling and simulation of electrical networks performed using dedicated software (e.g. DigSILENT PowerFactory) in small groups, supplemented with analytical calculations.

### Bibliography

6. Rozporządzenie Ministra Gospodarki z dnia 4 maja 2007 r. w sprawie szczegółowych warunków funkcjonowania systemu elektroenergetycznego (Dz.U. 2007 nr 93 poz. 623) z późniejszymi zmianami

7. Ustawa z dnia 10 kwietnia 1997 r. - Prawo energetyczne (Dz.U. 1997 Nr 54 poz. 348) z późniejszymi zmianami

### Breakdown of average student's workload

|   | Hours | ECTS |
|---|-------|------|
| Total workload  | 79    | 3,0  |
| Classes requiring direct contact with the teacher   | 40    | 2,0  |
| Student's own work (literature studies, preparation for laboratories and tests, preparing reports) <sup>1</sup> | 39    | 1,0  |

<sup>1</sup> delete or add other activities as appropriate
