

COURSE DESCRIPTION CARD - SYLLABUS

Course name

Large Scale Computing

Course

Field of study

Bioinformatics

Area of study (specialization)

Level of study

First-cycle studies

Form of study

full-time

Year/Semester

3/6

Profile of study

general academic

Course offered in

Polish

Requirements

compulsory

Number of hours

Lecture

15

Tutorials

Laboratory classes

30

Projects/seminars

Other (e.g. online)

Number of credit points

3

Lecturers

Responsible for the course/lecturer:

dr inż. Rafał Walkowiak

Responsible for the course/lecturer:

Prerequisites

The student starting this course should have knowledge of the computer organization, algorithms and data structures, operating systems and programming in the C language.

Course objective

Provide students with basic knowledge of parallel and distributed processing, including: models, computing systems, environments and languages, problems and methods of solving them.

Developing students' skills in: solving tasks in the field of processing and optimization of processing in a parallel and distributed computing systems, comparing the effectiveness of parallel processing carried out with the use of various environments and equipment.

Course-related learning outcomes

Knowledge

The student has ordered, theoretically founded knowledge of parallel programming paradigms, parallel and distributed computer systems and environments, parallel processing algorithms and their complexity evaluation.

The student has knowledge of the directions of development of architectures of parallel computer systems.

The student knows the methods, techniques and tools used to solve computer science tasks in the field of parallel and distributed programming.

Skills

The student is able to properly plan and perform experiments to evaluate the effectiveness of parallel processing, interpret the results and correctly draw conclusions from them.

The student is able to solve problems in the field of parallel processing using appropriate experimental methods and environments.

The student has the ability to formulate parallel algorithms and their implementation in the MPI, OpenMP and CUDA environments.

The student is able to cooperate and work in a group by carrying out projects and research on the implementation and evaluation of the effectiveness of parallel algorithms.

Social competences

The student is aware of the importance of the knowledge - regarding both hardware and software of parallel systems - needed in solving problems in the field of parallel processing optimization.

The student understands the need to broaden the knowledge and skills resulting from technological progress in the field of parallel processing equipment.

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Formative assessment:

- during lectures is based on answers to questions related to the material covered in previous lectures;
- during laboratory classes is based on assessment of the current progress and the results of the ongoing and finished tasks and projects .

Total assessment:

- verification of assumed learning objectives related to lectures is performed by assessment of the knowledge and skills during a final test consisting of close-ended questions of multiple-choice answers and hand assessed open-ended questions of a problem nature.
- verification of assumed learning objectives related to laboratory classes by evaluation of student's knowledge necessary to prepare and carry out the lab tasks, monitoring students' activities during classes, evaluation of laboratory reports (partly started during classes, finished after them).

Programme content

Internal parallelism of general purpose single processor computing systems, pipelining and super scalar architecture.

Classifications and examples of parallel systems (multi core systems, GPU and multicomputer systems).

Processor cache memory and coherency of cache in multiprocessor systems.

Communication in parallel systems - method of communication (synchronic, asynchronic, buffered, unbuffered), cost of communication, algorithms of group communication.

Basics of efficiency evaluation of parallel algorithms and parallel systems, scalability, Amdahl and Gustafson laws.

Parallel processing models (shared memory, message passing, data parallelism).

Parallel programming environments and standards: OpenMP, CUDA, MPI.

Parallel algorithms for sorting, matrix multiplication, primary numbers search.

The lab-classes are focused on: practical exercises with software implementations (Open MP, CUDA, MPI) for selected problems in a network of computing systems, parallel multicore systems and GPU, efficiency evaluation of different approaches.

Teaching methods

Lectures: presentation illustrated with examples on a black board, homeworks connected to the lecture.

Labs: presentation of work, configuration and use of parallel and distributed environments and tools; discussion of the results and parallel processing efficiency for experiments performed on code prepared by students in various systems.

Bibliography

Basic

1. Wprowadzenie do obliczeń równoległych, Z. Czech, PWN, Warszawa, 2013
2. Cuda w przykładach: wprowadzenie do ogólnego programowania procesorów GPU, J.Sanders, E.Kandrot, Helion, 2012
3. Introduction to Parallel Computing, A.Grama, A.Gupta, G.Karypis, V.Kumar, Addison Wesley, 2003

Additional

Specifications and manuals for graphic cards, OpenMP, MPI, CUDA and Parallel Studio.

Breakdown of average student's workload

	Hours	ECTS
Total workload	75	3,0
Classes requiring direct contact with the teacher	45	2,0
Student's own work (literature studies, preparation for laboratory classes, preparation for exam, project preparation) ¹	30	1,0

¹ delete or add other activities as appropriate
