

## COURSE DESCRIPTION CARD - SYLLABUS

Course name

Smart distribution grids

### Course

Field of study

Electrical power engineering

Area of study (specialization)

Smart grids

Level of study

Second-cycle studies

Form of study

part-time

Year/Semester

2/4

Profile of study

general academic

Course offered in

polish

Requirements

elective

### Number of hours

Lecture

10

Laboratory classes

20

Other (e.g. online)

0

Tutorials

0

Projects/seminars

10

### Number of credit points

4

### Lecturers

Responsible for the course/lecturer:

dr inż. Krzysztof Łowczowski

Responsible for the course/lecturer:

dr inż. Bartosz Olejnik

Wydział Inżynierii Środowiska i Energetyki

Wydział Inżynierii Środowiska i Energetyki

tel. 61 665 2581

tel. 61 665

### Prerequisites

Fundamental knowledge in electrical power engineering - short-circuit calculations, calculations of power flows, etc. Knowledge about the elements of a traditional power grid and knowledge about principles of operation of power grids. Knowledge about basic control systems and protection relays.

### Course objective

Knowledge about principles of operation of smart grids, in particular advanced knowledge about local energy sources, regulation devices and moder loads - electric cars, energy storage systems. Ability to perform advanced short-circuit calculations in networks containing active elements. Ability to use power system optimization tools, e.g. optimization of power flows or estimation of electrical quantities. Knowledge about selected, advanced protection relay functions and control systems in the distribution

network. Knowledge of measurement systems used in distribution networks. The ability to identify and solve problems with power quality and disturbances. Basics of network development planning and automation construction.

### Course-related learning outcomes

#### Knowledge

The student has a well-established knowledge of the construction of power grids, the phenomena occurring in them, operating states and methods of analyzing conventional and intelligent networks, including distributed generation and other active elements.

The student has knowledge of the elements of the power system and power system operation control, as well as the methods of using protection automation and ICT technologies to protect the power grid and devices.

#### Skills

The student is able to use modern IT tools and numerical methods to design and analyze the operation of power systems and protection automation.

#### Social competences

The student is aware of the problems related to energy security. The student is able to creatively solve problems related to power systems, taking into account economic issues and broadly understood entrepreneurship. The student understands the need to make the society aware of the development of modern power engineering and the dangers of development.

### Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

#### Lecture

- assessment of knowledge and skills shown in the written test; the colloquium consists of 10 questions (test and open-ended questions) with different scores; pass mark 50% of points + 0.5 points;
- continuous assessment in each class (rewarding activity);

#### Laboratories

- assessment of knowledge based on activity in the classroom
- assessment of knowledge on the basis of 2 tests
- assessment of knowledge on the basis of 3 prepared reports

#### Project

- project task report.

### Programme content

#### Lecture

Algorithms for controlling the operation of local energy sources and other modern network elements. Advanced calculations of power networks taking into account many computer tools. Global optimization of equipment operation in the distribution network. Operation of distribution networks in the context of transmission networks, eg LVRT, participation in reactive power regulation. Measurements of power quality and disturbances. Methods of improvement of the quality of electrical energy. Advanced protection relays and automation functions in distribution networks. Selected issues related to current problems.

#### Lab

Examples and tasks related to lectures

#### Project

Selected issues related with the current problems of power networks, e.g. the integration of devices with the power grid or the design of power grid control systems

#### Teaching methods

Lecture: multimedia presentation, illustrated with examples given on the board and examples of computer simulations and other tools to support the operation of the power system

Lab: classes with the use of physical laboratory stations and classes in the computer laboratory

Project: multimedia presentation, illustrated with examples given on the board and examples of computer simulations, combined with students' independent work under the supervision of the teacher

#### Bibliography

##### Basic

1. Jan Machowski, Regulacja systemu elektroenergetycznego, Warszawa 2017
2. J. Machowski, Z. Lubośny, Stabilność systemu elektroenergetycznego, WNT 2018
3. A. Kanicki, Systemy Elektroenergetyczne

##### Additional

Nicolaie Fantana, Krzysztof Lowczowski, Radek Javora i inni, Substation servicing and supervision using mobile devices and smart sensing, CIGRE, grudzień 2020.

### Breakdown of average student's workload

	Hours	ECTS
Total workload	100	4,0
Classes requiring direct contact with the teacher	40	2,0
Student's own work (literature studies, preparation for laboratory classes/tutorials, preparation for tests/exam, project preparation) <sup>1</sup>	60	2,0

<sup>1</sup> delete or add other activities as appropriate
