

COURSE DESCRIPTION CARD - SYLLABUS

Course name

Monitoring in the electric power system

Course

Field of study

Electrical power engineering

Area of study (specialization)

Intelligent distribution networks

Level of study

Second-cycle studies

Form of study

full-time

Year/Semester

2/4

Profile of study

general academic

Course offered in

polish

Requirements

elective

Number of hours

Lecture

10

Laboratory classes

10

Other (e.g. online)

0

Tutorials

0

Projects/seminars

0

Number of credit points

2

Lecturers

Responsible for the course/lecturer:

Wojciech Sikorski, Ph. D., Eng.

Responsible for the course/lecturer:

Faculty of Environmental Engineering and
Energy

Institute of Electric Power Engineering

e-mail: wojciech.sikorski@put.poznan.pl

tel. 61 665 2035

Prerequisites

The student has knowledge of mathematics and numerical methods necessary for the synthesis of models and power systems. Student has knowledge of the theory of signal processing and telecommunications used in the power industry and the construction of information systems. Student has knowledge of the construction and operation of measuring equipment and measuring techniques used in the power industry. Student is able to use computer simulations and telecommunications tools to analyze and evaluate the phenomena occurring in the power system.

Course objective

Presentation of the construction and areas of application of supervision and monitoring systems in the

power industry. Review of data processing methods in power engineering expert systems: artificial neural networks, evolutionary algorithms and fuzzy logic. Presentation of selected monitoring and supervision systems with built-in expert functions. Basics of programming the software layer of monitoring systems.

Course-related learning outcomes

Knowledge

1. Student has detailed knowledge of the construction of monitoring systems used in the power system
2. Student has an extended knowledge of the processing, acquisition and visualization of measurement data
3. Student has detailed knowledge of the integration of sensors and measuring transducers with the SCADA monitoring system

Skills

1. The student is able to process, visualize and correctly interpret the measurement data recorded by the monitoring system
2. The student is able to use selected IT tools to develop elements of the programming layer of the monitoring system
3. The student is able to use the monitoring system for diagnostics of electric power devices and accessories

Social competences

1. The student is aware of the role of the systems for monitoring the operating condition of electric power equipment and transmission networks in ensuring the continuity of electricity supply to industry and the population.
2. The student is aware of the scale of threats and the impact of the consequences of failure of electrical power equipment on the natural environment.

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Lecture: written test

Laboratories: exercise report; computer application

Programme content

Lecture

1. Hardware architecture of individual modules of the monitoring system used in the power industry (communication controllers, signal concentrators, object/field controllers, server of the monitoring

system and databases for operating operator stations, operator stations, real-time servers, devices implementing communication such as protocol converters, switches, routers, multiplexers, etc.)

2. Review of monitoring systems and their expert functions intended for monitoring transmission and distribution lines, substations, power plants and key devices of the el-en system (transformers, generators, switchgears) and review of systems for energy quality assessment
3. Methods of processing and visualization of measurement data recorded by the monitoring system
4. Review of software for creating the program layer of supervision and monitoring systems

Laboratories

1. SYNDIS substation control and supervision system
2. Online monitoring system of an energy transformer
3. Electricity quality evaluation system in the distribution company
4. Creating a control and supervision application using LabVIEW Datalogging and Supervisory Control Module

Teaching methods

Lecture: multimedia presentation supplemented with examples given on the blackboard. Theory presented in close connection with practice

Laboratories: laboratory exercises carried out in groups, configuration and operation of monitoring systems, computer exercises related to the programming of supervision and monitoring systems and the analysis of measurement data

Breakdown of average student's workload

	Hours	ECTS
Total workload	50	2,0
Classes requiring direct contact with the teacher	20	1,0
Student's own work (literature studies, preparation for laboratory classes, preparation of reports, preparation for written test) ¹	30	1,0

¹ delete or add other activities as appropriate
