

COURSE DESCRIPTION CARD - SYLLABUS

Course name

High voltage engineering

Course

Field of study

Electrical Engineering

Area of study (specialization)

Level of study

Second-cycle studies

Form of study

full-time

Year/Semester

2/3

Profile of study

general academic

Course offered in

English

Requirements

compulsory

Number of hours

Lecture

15

Laboratory classes

15

Other (e.g. online)

Tutorials

Projects/seminars

Number of credit points

3

Lecturers

Responsible for the course/lecturer:

dr inż. Wojciech Sikorski

email: wojciech.sikorski@put.poznan.pl

tel. (61) 665 20 35

Faculty of Environmental Engineering

and Energy

ul. Piotrowo 3A, 60-965 Poznań

Responsible for the course/lecturer:

Prerequisites

The student is able to name and characterize the basic physical phenomena occurring in electrical insulating materials and to list and characterize the typical structures of high voltage power devices. In addition, the student has the ability to perform basic diagnostic measurements of high-voltage power devices and the values that characterize the high-voltage insulation system. The student is able to work and cooperate within a team

Course objective

Construction of high-voltage equipment and insulation systems. The methods for proper selection of high-voltage insulation materials. The parameters and physical phenomena in diagnostics of high-voltage equipment. The review of modern diagnostic techniques and assessment of the insulation condition of high-voltage equipment. The digital processing and proper interpretation of measurement data for assessment of high-voltage equipment condition.

Course-related learning outcomes

Knowledge

1. The student has an extended knowledge of the construction and operation of insulation systems of high voltage devices
2. The student has knowledge of the physicochemical phenomena occurring in high voltage insulation systems.
3. The student has detailed knowledge of the diagnostics of high voltage devices and has knowledge of the development of experimental results.

Skills

1. The student is able to plan the process of testing and diagnosing the high-voltage insulation system
2. The student is able to process and correctly interpret the results of diagnostic measurements used to assess the technical condition of a high voltage device.
3. The student is able to obtain information from the literature and other sources related to the construction and diagnostic methods of high voltage devices.

Social competences

1. The student recognizes the importance of knowledge in the field of diagnostics of high-voltage power devices and accessories in ensuring the continuity of electricity supply for industry, institutional and individual consumers.
2. The student is aware of the scale of threats and the impact of the consequences of failure of high voltage devices on the natural environment.

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Lectures:

- evaluation of knowledge and skills proven on written or oral examinations during examination session

Laboratory classes:

- tests and rewarding knowledge necessary to realise basic problems in the given laboratory task field
- continuous evaluation, on each class - rewarding improvement of ability to use the known rules and methods,
- evaluation of knowledge and skills related to realisation of laboratory task, evaluation of report on task carried out,
- evaluation of knowledge and skills proven on written or oral test.

Programme content

- The problem of partial discharges occurring in high-voltage insulation systems

Lectures:

- Physicochemical degradation processes occurring in high voltage insulation systems
- Problems of partial discharges occurring in high voltage insulation systems
- Problems of moisture of paper-oil insulation
- Methods of high-voltage equipment diagnostics:

- a) methods of partial discharges detection (electromagnetic HF/UHF, AE, conventional IEC 60270),
- b) methods of moisture content evaluation (Karl-Fischer, capacitive probes),
- c) detection methods of power transformer windings deformation (FRA/SFRA),
- d) dissolved gas analysis (DGA),
- e) partial discharge localization techniques (trilateration, standard auscultatory technique SAT).

Laboratory:

- Detection and location of partial discharges using acoustic emission method (AE)
- Measurement of partial discharges using conventional electric method (PN-EN 60270)
- Detection of partial discharges registered in HF/UHF frequency band
- Detection of power transformer insulation system defects basing on analysis of gases dissolved in insulation oil
- Evaluation of moisture content insulation system using physicochemical methods (Karl-Fischer, capacitive probe)
- Detection of power transformer windings deformation using FRA/SFRA method

Teaching methods

Lecture: multimedia presentation (including drawings, photos, animations) supplemented with examples given on the board, taking into account various aspects of the issues presented, including: economic, ecological, legal and social issues, presenting a new topic preceded by a reminder of related content known to students in other subjects .

Laboratory: detailed review of reports, demonstrations, teamwork.

Breakdown of average student's workload

	Hours	ECTS
Total workload	60	3,0
Classes requiring direct contact with the teacher	30	1,5
Student's own work (literature studies, preparation for laboratory classes/tutorials, preparation for tests/exam, project preparation) ¹	30	1,5

¹ delete or add other activities as appropriate
