

COURSE DESCRIPTION CARD - SYLLABUS

Course name

Smart signal processing

Course

Field of study

Electrical Engineering

Area of study (specialization)

Intelligent Measurement Systems

Level of study

Second-cycle studies

Form of study

full-time

Year/Semester

1 / 2

Profile of study

general academic

Course offered in

English

Requirements

elective

Number of hours

Lecture

15

Laboratory classes

15

Other (e.g. online)

0

Tutorials

0

Projects/seminars

0

Number of credit points

2

Lecturers

Responsible for the course/lecturer:

Ph.D. Eng. Piotr Kuwałek

email: piotr.kuwalek@put.poznan.pl

Responsible for the course/lecturer:

Phone: 61 665 2642

Faculty of Control, Robotics and Electrical

Engineering

Piotrowo 3A 60-965 Poznan

Prerequisites

Student should have basic knowledge of mathematics, electrical engineering and programming basics, as well as the ability to work in a laboratory group. Student should also have the ability to in-depth understanding and interpretation of the informations and effective self-education in the field related to the selected field of study. Student should be aware of the need to expand their competences and should be ready to cooperate as part of the team.

Course objective

Increase of the student's knowledge of general signal theory, including advanced signal processing algorithms used in the expert systems. The student's understanding of the limitations of digital signal processing resulting from, e.g., from aliasing, spectrum leakage, problem of recreation of signal from samples. Increase of the student's knowledge in the field of signal analysis tools in the time, frequency,

time and frequency domains. Increase of the student's knowledge in the field of filter design. Improvement practical skills in using engineering tools in signal processing.

Course-related learning outcomes

Knowledge

1. Student has knowledge of the basics of signal processing theory.
2. Student has knowledge of the limitations of discrete signal processing.
3. Student has knowledge of the frequency analysis of analog and discrete signals.
4. Student has knowledge of the operation and design of digital filters.
5. Student has knowledge of advanced tools for signal processing, which are used, e.g., in expert systems.

Skills

1. Student is able to experimentally verify the limitations of discrete signal processing.
2. Student is able to use engineering tools for the analysis and processing of analog and discrete signals.
3. Student is able to design a filter with specific properties with the use of computer aid.

Social competences

1. Understanding a need of the act enterprisingly in the area of the advanced signal processing.
2. Understanding a need of the broad populatrization of the knowledge in the area of simple and complex signal processing tools.

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Lecture:

evaluation of knowledge and skills by tests. The test pass threshold is 50%. Considering activities of students in the laboratory classes as well as lectures.

Laboratory:

The skills obtained during the laboratory exercises are verified either on the basis of reports made by students at home after the exercises, or on the basis of an application prepared in a selected environment, in which advanced methods for signal processing learned during the classes are implemented. Exercises are held in a parallel form. During the laboratory classes, verbal preparation of students for the exercise is verified. Completion the laboratory classes requires the completion of all exercises and individual implementation indicated reports or applications with indicated functionalities.

Programme content

Methods of education are orientated to students to motivate them to participate actively in education process by discussion and reports.

Lecture:

L1: General elements of signal processing theory (signal concept, signal classification, signal-information relationship, signal representations, signal parameters, distribution signals).

L2: Signal sampling. Analysis of discrete stationary signals - DFT algorithm. Analysis of discrete non-stationary signals - STFT analysis. Introduction to the wavelet theory - CWT and DWT.

L3: Correlation analysis of the signal (autocorrelation function, cross-correlation function, relationship of the autocorrelation function with the spectrum). The problem of estimation of the fundamental frequency of a signal.

L4: Selected issues of filtering discrete signals. Statistical filters. Filters with finite and infinite impulse response. The problem of signal decomposition and a conceptual presentation of new decomposition methods (EMD, VMD, EWT, HHT).

L5: AM/FM/PM modulation of signals and analytic representation of the signal.

L6: Basics of machine learning. Supervised and unsupervised learning. Selected methods of clustering.

L7: Smart signal processing with the use of artificial intelligence methods.

Laboratory:

Lab1: OHS + introduction to Matlab/Python.

Lab2: Introduction to Matlab/Python.

Lab3: Determination of selected signal parameters. FFT analysis of signals.

Lab4: Determination of the fundamental frequency of the signal (autocorrelation function, cepstrum, FFT, zero-crossing detection).

Lab5: Construction of statistical filters with a finite and infinite impulse response.

Lab6: Determination of the analytic representation of the signal. Signal decomposition with the use of selected empirical decomposition methods (EWT, VMD, EMD).

Lab7: Presentation of the Scikit-Learn package to support signal processing using artificial intelligence methods.

Teaching methods

Lecture: Multimedia presentations (including figures, photos, videos) with examples given on the blackboard. Theoretical issues are presented in close connection with practice.

Laboratory: carrying out laboratory exercises individually or in small teams (implementation of signal processing methods, use of engineering signal processing tools) with the help and supervision of the teacher.

Breakdown of average student's workload

	Hours	ECTS
Total workload	59	2,0
Classes requiring direct contact with the teacher	30	1,0
Student's own work (literature studies, preparation for laboratory classes, preparation for laboratory classes, preparation of reports or preparation of applications, preparation for tests) ¹	29	1,0

¹ delete or add other activities as appropriate
