COURSE DESCRIPTION CARD - SYLLABUS

Course name

Course

Field of study
Electric Power Engineering
Area of study (specialization)
common courses
Level of study
Second-cycle studies
Form of study
part-time

Year/Semester
1/2
Profile of study
general academic
Course offered in
polish
Requirements
compulsory

Number of hours

Lecture

Laboratory classes
20

Other (e.g. online)

Tutorials

Projects/seminars

Number of credit points

2

Lecturers

Responsible for the course/lecturer:
dr inż. Andrzej Kwapisz

Faculty of Environmental Engineering and Energy

email:andrzej.kwapisz@put.poznan.pl

phone 616652282

Responsible for the course/lecturer:

Prerequisites

Has basic knowledge in the field of electrical engineering, energy and computer operation.

The ability to effectively self-study in a field related to the chosen field of study. Is able to operate a computer at a basic level.

Is aware of the need to expand their competences. Understands the need to use computer programs at work.

Course objective

Understanding the application of computer methods in the calculation of power systems and networks as well as power plants and power system. The use of computer technology in controlling energy processes. Getting to know practical methods of determining short-circuit quantities and determining short-circuit hazards for elements of the power system. Understanding the basics of optimization theory and decision-making processes in the energy sector. Solving simple optimization problems.

Course-related learning outcomes

Knowledge

1. Has knowledge in the field of methodology and principles of calculating systems, power networks as well as power plants and the power system.

2. Has knowledge in the field of decision support and optimization of power plant, network and power system operation.

3 Has knowledge of modeling of devices and elements of the power system and occurring phenomena.

Skills

1. Can carry out basic calculations and costs analysis in the power sector

2. Is able to model the power structure of the power facility, working system in normal and emergency conditions using.

3. Is able to apply the calculation tools necessary to determine the conditions of safe operation of the power system.

Social competences

1. Is aware of the need to use modern decision support methods and design to achieve a high quality technical solution.

2. Understands the need to obtain economic and social acceptability for the chosen technical solution.

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Laboratory: verification of individual preparation for classes, including material from a single exercise or block of exercises, assessment of individual exercise reports made by the student, colloquium at the end of the semester, colloquium includes test questions or problem tasks, all grades on a scale of 0 to 100%, final grade based on the weighted average of all component ratings

Programme content

Laboratory

Modeling of transmission and distribution networks, interference in power networks. Calculation of network parameters, transmission systems and power equipment, calculation of protection systems settings. Algorithms for estimation of power system states

Teaching methods

Laboratory: implementation of exercises, use of publicly available information and software tools to support the didactic process, encouraging students to independently search for optimal solutions and problem solving

Breakdown of average student's workload

	Hours	ECTS
Total workload	56	2
Classes requiring direct contact with the teacher	28	2
Student's own work (literature studies, preparation for laboratory classes, preparation of lab reports) [1]	28	1

1 delete or add other activities as appropriate
