

COURSE DESCRIPTION CARD - SYLLABUS

Course name

Selected Cryptographic Issues

Course

Field of study

Computing

Area of study (specialization)

Level of study

First-cycle studies

Form of study

part-time

Year/Semester

4/7

Profile of study

general academic

Course offered in

Polish

Requirements

elective

Number of hours

Lecture

12

Laboratory classes

12

Other (e.g. online)

Tutorials

Projects/seminars

Number of credit points

2

Lecturers

Responsible for the course/lecturer:

Anna Grocholewska-Czuryło, PhD

Responsible for the course/lecturer:

Prerequisites

Student starting this subject should have the knowledge of basic algorithms including their analysis, operating systems, computer networks and fundamentals of cryptography. The student should be able to manage programming environments and platforms for applications' writing, executing and testing. Student should be able to design algorithms and perform an analysis of their complexity.

Course objective

The objective of this course is to provide students with selected advanced cryptographic issues. Students should gain the ability to use these methods in practice.

Course-related learning outcomes

Knowledge

Student has a detailed knowledge about:

- current cryptographic problems and solutions,
- design and analysis of block ciphers, hash functions and asymmetric ciphers,

- advanced protocols and cryptographic algorithms like calculations on elliptic curves, cryptocurrencies, secure multi-party computations.

Skills

Student is able to:

- design and implement systems with the use of appropriate cryptographic methods in order to ensure privacy and integrity as well as authentication of stored and analyzed data sets in these systems,
- analyze and estimate the level of security of cryptographic mechanisms and evaluate whether a certain system is immune to known cryptographic attacks,
- propose, design and implement alternative cryptographic mechanisms to ensure a higher level of security.

Social competences

The student understands:

- how important it is to implement adequate data security methods,
- that an implementation of appropriate cryptographic algorithms is equally important,
- the necessity of updating knowledge on security parameters, algorithms, protocols and tools used.

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

The knowledge obtained during the lectures is verified by the means of a 45-minutes written test, consisting of 5 question. Passing threshold: over 50% of points. Topics, which are the basis for final exam questions, are sent to students by e-mail at the beginning of the semester.

The knowledge obtained during lab practicals is verified during the practicals (checking the preformed exercises).

Programme content

Lecture:

1. Introduction - challenges of modern cryptography, introduction to the design of block ciphers and hash functions, random number generators.
2. Block cipher components and criteria they must meet. Cryptanalysis of ciphers.
3. Algorithms on elliptic curves.
4. Multi-party computations, examples of practical applications.
5. Authenticated encryption.
6. Cryptocurrencies, smart contracts.

Lab practicals

1. Analysis of selected substitution blocks, permutation blocks and key generation algorithms.
2. Differential cryptanalysis.
3. Implementation of the selected algorithm on an elliptic curve.
4. Analysis of authenticated encryption algorithms.
5. Implementation of the selected problem of bilateral computations.
6. Analysis of cryptocurrency security.

Teaching methods

The lectures are interactive (questions are addressed to students) with the use of multimedia presentations. The digital version of the contents of the presentations are provided to students.

Lab practicals - presentations regarding the problem/exercises to be performed on the board (within the basic level of difficulty and also with higher difficulty for volunteers) and performing an individual exercise in a programming language of choice.

Additional

Materials shared by the lecturer, updated every year.

Breakdown of average student's workload

| | Hours | ECTS |
|--|-------|------|
| Total workload | 50 | 2,0 |
| Classes requiring direct contact with the teacher | 24 | 1,0 |
| Student's own work (literature studies, preparation for laboratory classes, preparation for exam) ¹ | 26 | 1,0 |

¹ delete or add other activities as appropriate
