7

Lecturers

Responsible for the course/lecturer:

Responsible for the course/lecturer:

dr eng. Andrzej Szymański

e-mail: Andrzej.Szymanski@put.poznan.pl

Faculty of Chemical Technology

street: Berdychowo 4, 60-965 Poznań

phone: (61) 665 2806

Prerequisites

Knowledge:

Student:

W1) Has theoretical knowledge at high school level in the field of general and inorganic chemistry, in particular: knows the basic laws, concepts and chemical quantities as well as the names and symbols of chemical elements

W2) Has knowledge at high school level in the field of physics and, in particular, knows the basics of the structure of matter and identifies the components of the atomic nucleus and atom

W3) Has knowledge at high school level in mathematics, especially regarding proportions and using them in simple calculations

Skills:

Student:

U1) Writes summary formulas for simple inorganic compounds

U2) Writes simple chemical reactions involving inorganic reagents

U3) Performs basic chemical calculations and, in particular, can calculate and recalculate the percentage and molar concentrations of solutions; can make other calculations based on the skill of stacking proportions (percentage composition of chemical compound, purity and degree of reacting substrates, yield of reaction products)

Social competences:

Student:

K1) Is determined to acquire knowledge in chemistry as an exact subject being the basis for thorough education in many engineering professions

K2) Demonstrates interest in ways of carrying out useful chemical processes on an industrial scale, and, at the same time, understands environmental protection problems, including mainly problems of minimizing chemical pollution

Course objective

Showing chemistry as a science in constant dynamic development. Expanding and strengthening the ability to perform calculations in the field of solution concentrations and stoichiometry as well as basic thermodynamic calculations. Expanding knowledge of general and inorganic chemistry and its systematization based on types of chemical reactions (detailed discussion of acid-base reactions and precipitation reactions) and the law of periodicity. Showing the relationship between the properties of compounds and the type of chemical bonds in their molecules

Course-related learning outcomes

Knowledge

1. Student has extended knowledge regarding the structure of matter; identifies the components of matter and characterizes the interactions between them; knows the structure of atoms and the genesis of their creation; defines and explains the laws governing the interaction of matter components at both the nuclear and atomic levels (K_W02)

2. Indicates the properties of elements resulting from the electronic configuration of their atoms and their position in the periodic table and, in particular, knows and explains the relationship between the electronic configuration of atoms and the reactivity of elements (K_W03)
3. Knows the basic laws of thermodynamics and chemical kinetics as well as thermodynamic functions that allow to uniquely describe and characterize the energy state of the reaction system (K_W10)

Skills

1. Student analyzes and interprets the content of computational tasks and performs chemical calculations (mainly in the field of concentration conversion, stoichiometry and basics of thermodynamics of chemical reactions) (K_U01)
2. Uses the periodic table of elements and is able to use it as a basic source of information about the physicochemical properties of elements and their compounds (K_U01, K_U24)
3. Uses the current nomenclature of inorganic compounds and is especially able to combine the correct name of the compound with its correct summary (stoichiometric) formula, which can correctly write, and on this basis prepare its structural formula (K_U01, K_U17, K_U19)
4. Writes and correctly balances chemical reactions and is able to predict the direction of chemical reactions of any type; can quantify the steady state of the reaction (he can calculate the equilibrium constant of a chemical reaction) (K_U01, K_U18)

Social competences

1. The student is aware of the continuous, rapid increase in knowledge in the field of inorganic chemistry and, as a result - the level of his knowledge in this field, which causes him to further study and assimilate new knowledge on his own initiative, with determination and an active attitude (K_K01)
2. Is aware that knowledge regarding inorganic chemistry is widely used in industry and the economy; understands and reckons with the necessity of practical use of acquired knowledge and skills in the future; is aware of the responsibility associated with this (K_K02, K_K06)

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Lecture: passing the lecture is carried out in the form of stationary or remote test (depending on the method of conducting classes). The test may contain approximately 20-25 questions, open and closed. The threshold of pass the test: 50% of the total points. Based on the number of points obtained, the final grade is issued, according to the rating scale in force at Poznan University of Technology.

Exercises: after completing a given batch of material, the teacher organizes, in predetermined dates, two partial tests (stationary or remote tests, depending on the form of conducting classes), consisting of variously scored questions. Both tests must be completed successfully, i.e. with the score at least 50% of the points. Based on the sum of points from both tests, the final grade for exercises is given, according to the scale of grades in force at the Poznan University of Technology.

Programme content

Lecture (part 1):

1. Chemical calculations. Different types of concentrations. Percentage. Mole and molar concentration. Weight equivalent and normal concentration. Conversion of concentrations. Stoichiometric calculations
2. Structure of matter. Big bang. Nucleons and primary nucleosynthesis. Isotopes. Chemical processes in stars. Artificial nuclear reactions. Elemental distribution. Atom. Quantum numbers. Electron configurations of elements. Periodic table and periodicity of changes in physicochemical properties of elements. Regularities of the periodic table
3. Chemical bonds. Electronegativity. Ion bond. Atomic bond - Lewis structures. Dipole moment - polarization of the atomic bond. Coordination atomic bond. Metallic bond. Van der Waals forces. Hydrogen bond. Chemical bonds and the properties of compounds
4. Thermodynamics and reaction kinetics. Thermal effects of the reaction. Entropy and enthalpy. Gibbs energy. The effect of temperature and pressure on the reaction balance. Properties of gases and mixtures thereof. Liquid thermodynamics, chemical potential, nonelectrolyte solutions, gas-liquid and liquid-solid equilibria (phase diagrams). Solid state thermodynamics. Kinetics of chemical reactions. First and second order reactions, single and double molecule reactions. Theory of active complex, Arrhenius and Eyring equations. Reversible, parallel and sequential reactions. Chain reactions. Combustion and explosive reactions. Photochemical reactions. Hetero- and homogeneous catalysis - catalysts
5. Acids and bases. Electrolytic dissociation. Strong and weak electrolytes. Concentration and activity - activity coefficients, ionic strength. Theories of acids and bases. Ionic product of water and the pH scale. The power of acids and bases. Acid-base indicators. Degree and acid constant. Buffer solutions. Ampholyts. Acid-base titration. The reaction of aqueous solutions of acids, bases and salts. Hydrolysis. pH measurement
6. Precipitation. Structure of compounds and solubility. Solubility product. Solubility. Common ion effect. Salt effect. The effect of pH on dissolution and selective precipitation. Solubility of compounds and their toxicity. Water hardness - removal of hardness

Exercises:

1. Exercises based on the periodic table (names and symbols of elements, electronic configurations, summary and structural formulas of compounds, inorganic nomenclature)
2. Conversion of concentrations (types of concentration, percentage and molar concentration, solution density and molar/molecular mass in the calculation)
3. Stoichiometric calculations (summary formula and compound percentage, product yield, substrate purity, obtaining reaction data)
4. Electrolyte solutions (writing of dissociation and hydrolysis reactions, reactions of cations as acids and anions as bases, water as solvent - ionic product of water and pH scale, calculation of the pH of aqueous

solutions of acids, bases, salts and buffer solutions, acid dissociation constant and degree of dissociation)

5. Calculations using reaction heat (enthalpy, entropy, thermodynamic potential, equilibrium constant and reaction rate constant)
6. Sediments (relationship between solubility product constant and solubility - calculation of compound, cation and anion solubility)
7. Complex compounds (construction of complexes - summary formulas, nomenclature, calculation of equilibrium in complex solutions - stability constant and permanent instability constant of complexes)
8. Oxidation and reduction reactions (balancing redox reactions, predicting the direction of redox reactions based on oxidation-reduction potentials, drawing Pourbaix charts and discussing the properties of elements on their basis)

Teaching methods

Lecture: based on multimedia presentations containing relevant examples; as a complement, additional examples with explanations, resulting from the current interest of the students.

Classes: short multimedia presentations with the theoretical foundations of the practiced subject; example calculations performed by the teacher; practical exercises - students solve problems or tasks indicated by the teacher (the solutions are regularly commented and interpreted by students with the help of the teacher).
