

COURSE DESCRIPTION CARD - SYLLABUS

Course name

Electromobility and energy storage [N1Eitech1>E-EiME]

Course

Field of study

Electrical Engineering

Year/Semester

5/9

Area of study (specialization)

–

Profile of study

general academic

Level of study

first-cycle

Course offered in

polish

Form of study

part-time

Requirements

elective

Number of hours

Lecture

20

Laboratory classes

10

Other (e.g. online)

0

Tutorials

0

Projects/seminars

10

Number of credit points

4,00

Coordinators

dr hab. inż. Leszek Kasprzyk prof. PP
leszek.kasprzyk@put.poznan.pl

Lecturers

Prerequisites

Basic knowledge of electrical engineering, electrical machines, and forms and methods of energy conversion. Ability to interpret transmitted messages and effective education in the field related to energy storage and hybrid systems as well as teamwork.

Course objective

To familiarize students with the current state and directions of electromobility development in Poland and in the world. Presentation of the classification and general characteristics of electric energy storage facilities and presentation of selected methods of testing and fastening them.

Course-related learning outcomes

Knowledge:

Structured knowledge in the field of electromobility.
hybrid vehicles.

Skills:

Able to classify and analyze the operation of the propulsion system and energy storage in electric and

hybrid vehicles.

Able to research, analyze and model the work of selected electricity storage facilities used in mobile systems.

Social competences:

Is aware of the growing energy problem in the world.

Understand various aspects and effects of electrical engineer activities, including environmental impact

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Learning outcomes presented above are verified as follows:

Knowledge acquired as part of the lecture is verified during the written test, which takes place during the last lecture. The exam consists of open-ended points depending on the level of difficulty. Passing threshold: 50% of points. Final issues are sent by e-mail to the group staroste using the university e-mail system 2-3 weeks before the date of passing.

Completion of project classes is based on ongoing control of progress, class participation and implementation of the final project.

Completion of laboratory exercises is based on the assessment of theoretical and practical knowledge necessary to complete the task being carried out, verified on an ongoing basis during classes with students and on the basis of written reports on the task.

Programme content

The lecture:

History of vehicles, current statistics on transport and motorization worldwide. Worldwide electromobility including Poland. Methods of improving efficiency of motor vehicles. Technical parameters of electric and hybrid vehicles. Determining the power and energy requirements of a conventional vehicle. Selection and analysis of energy storage operation in a vehicle. Energy storage charging systems in electric and plug-in hybrid vehicles. Economic analysis of the profitability of electric and hybrid vehicles. Introduction to electrical storage. Classification of energy storage facilities. Parameters characterizing electrical storages (power density, energy, SOC, SOP, SOH, ready time).

Principles of operation of electrochemical batteries. Selection and analysis of operation of selected energy storages (modelling of lead-acid, lithium-ion and supercapacitors). Energy storage charging systems (wired and wireless), including electric and plug-in hybrid vehicles. Analysis of the profitability of energy storage. Methods and modelling of electrochemical energy storage (PbO₂, Li-Ion). Modelling of electrical energy storage systems (supercapacitors). Durability of electrochemical storages. Operation of energy storage in packages, BMS (active and passive balancers, etc.). UPS solution overview. Electric traction. Rail and individual transportation. Drones. Smart Grid, V2G.

The usage and tasks of energy storage facilities in the power system, including those with a significant share of unstable sources. Characteristics of mechanical storages (fly wheel, compressed air systems, pumped-storage power plants). Chemical storages (fuel cells and hydrogen).

The project:

Identification of parameters of the lithium-ion battery model. Identification of parameters of the supercapacitors model. Electrochemical impedance spectroscopy. Selection and design of installations containing energy storages.

The lab:

1. Tests of the charging and discharging process of lead-acid batteries (charging and discharging characteristics, determination of capacity, internal resistance, power density and energy).
2. Tests of the charging and discharging process of li-ion batteries (charging and discharging characteristics, determination of capacity, internal resistance, power density and energy)
3. Analysis of the operation of the lithium-ion battery pack (voltage balancers, thermal tests, including thermovision)
4. Identification of parameters of the lithium-ion battery model
5. Identification of parameters of the supercapacitors model
6. Kinetic storage - demonstration exercise; Lithium-ion battery with supercapacitor

Teaching methods

Lectures: Multimedia presentation, illustrated with examples on the board, initiating discussions during the

lecture. Additional materials are placed in the Moodle system.

Laboratory exercises: multimedia presentation illustrated with examples given on a blackboard, demonstrations and implementation of tasks given by the teacher - practical exercises

Projects: Didactic classes in the auditorium (calculations in books and on the board supported by the application in the Matlab environment).

Breakdown of average student's workload

	Hours	ECTS
Total workload	109	4,00
Classes requiring direct contact with the teacher	70	3,00
Student's own work (literature studies, preparation for laboratory classes/ tutorials, preparation for tests/exam, project preparation)	39	1,00
