

COURSE DESCRIPTION CARD - SYLLABUS

Course name

Theory of elasticity and plasticity [N2MiBM1>TSiP]

Course

Field of study

Mechanical Engineering

Year/Semester

2/3

Area of study (specialization)

Production Informatics and Robotics

Profile of study

general academic

Level of study

second-cycle

Course offered in

polish

Form of study

part-time

Requirements

compulsory

Number of hours

Lecture

12

Laboratory classes

0

Other (e.g. online)

0

Tutorials

8

Projects/seminars

0

Number of credit points

2,00

Coordinators

Lecturers

Prerequisites

Basic knowledge of general mechanics, material strength, algebra and vector calculus. Can think logically and learn with understanding, use textbooks. Is aware of the need to expand his competences. Understanding the need to learn and acquire new knowledge.

Course objective

Getting to know and understanding the main concepts, laws and equations of theory of elasticity and plasticity. The ability to apply the acquired knowledge to modeling engineering problems, analysis of numerical simulation results and inference.

Course-related learning outcomes

Knowledge:

1. The student who completed the course can define and explain the basic concepts, laws and equations of the theory of elasticity and plasticity.
2. The student is able to define and explain the basic concepts, laws and equations of the theory of elasticity.

Skills:

1. Student has the ability to solve problems in the theory of elasticity and plasticity.

2. Student has the ability to analyze and interpret the obtained result.
3. He understands the index notation and the abbreviated summation convention that are commonly used in solids mechanics and can employ them making simple calculations.

Social competences:

1. The student understands the importance of knowledge in the modern world. He is also well aware that the rapid development of knowledge causes the need for lifelong learning.
2. He can organise the processes of learning and self-education.

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Learning outcomes presented above are verified as follows:

Lecture: grade issued on the basis of a written test and points obtained during the exercises. The pass mark is 50% of the sum of the planned points, the grading scale is linear.

Classes: written credit - test. Passing the grade after obtaining at least 50% of the total points, linear grading scale

Programme content

Lecture

1. The index notation principles and the abbreviated summation convention. Elements of algebra and analysis of Cartesian tensors.
2. Vector and tensor transformation rules within Cartesian coordinate systems.
3. Modeling of external and internal forces exerting on solid bodies. Stress state analysis - the stress vector, the Cauchy stress tensor, the Cauchy stress formula.
4. The principal stresses and the eigenvectors, maximum normal and shear stress. The principal stresses and the eigenvectors.
5. The Lagrange (material) and the Euler (spatial) descriptions. The displacement vector, the deformation gradient and the gradient of the displacement vector.
6. Strain tensor; geometric interpretation of its components. The infinitesimal strain tensor. Interpretation of the infinitesimal strain tensor components. .
7. The constitutive relation of linear elasticity. The governing equations of linear elasticity for isotropic material - the stress formulation and the displacement formulation. Initial and boundary conditions
8. Basic constitutive models of elasto-plastic materials. Plasticity conditions.

Exercises:

1. Improvement of accounting skills concerning the use of the summation convention and index notation. Chosen elements of vectors and tensors algebra and analysis
2. Stress vector and stress tensor. Cauchy's law. Accounting examples.
3. Geometric and physical interpretation of problems leading to the formulation of the eigenvalues for strain and stress tensors. Solving examples.
4. Continuous medium deformation - material and spatial description. Relationships between deformation gradient, displacement gradient, deformation tensor and deformation tensor. Accounting examples.

Teaching methods

Lectures: multimedia presentations supported by commentary and solving examples.

Classes: problem solving, practical exercises and analysis of solutions, discussion.

Breakdown of average student's workload

	Hours	ECTS
Total workload	50	2,00
Classes requiring direct contact with the teacher	25	1,00
Student's own work (literature studies, preparation for laboratory classes/ tutorials, preparation for tests/exam, project preparation)	25	1,00
