COURSE DESCRIPTION CARD - SYLLABUS

Course name
Operating systems with concurrency programming [S1SI1E>SOP]

Course

Field of study
Artificial Intelligence

Year/Semester
1/2

Area of study (specialization)
–

Profile of study
general academic

Level of study
first-cycle

Course offered in
english

Form of study
full-time

Requirements
compulsory

Number of hours

Lecture
30

Laboratory classes
30

Other (e.g. online)
0

Tutorials
0

Projects/seminars
0

Number of credit points

5,00

Coordinators

dr inż. Dariusz Wawrzyniak
dariusz.wawrzyniak@put.poznan.pl

Lecturers

dr inż. Cezary Sobaniec
cezary.sobaniec@put.poznan.pl

dr inż. Jan Kończak
jan.konczak@put.poznan.pl

dr inż. Dariusz Wawrzyniak
dariusz.wawrzyniak@put.poznan.pl

Prerequisites

The student starting this module should have a basic knowledge of the computer structure and its working principle, selected elements of discrete mathematics, imperative programming skills (especially in C programming language) including implementation of simple algorithms. In respect to the social skills the student should show attitudes as honesty, responsibility, curiosity, and creativity.

Course objective

Course objective: 1. To acquaint students with theoretical and practical problems of the design and implementation of operating systems, especially resource management (e.g. processor, memory, I/O devices). 2. To teach students how to use a Unix-like operating system. 3. To develop the skills in concurrent programming as well as system programming including multitasking and multithreading, synchronisation mechanisms, and deadlock problem.

Course-related learning outcomes

Knowledge:
1. has theoretical knowledge of operating systems working,
2. has basic knowledge regarding trends in operating systems,
3. has well-established knowledge of concurrent programming problems and hazards arising from inappropriate synchronisation.

Skills:
1. can write concurrent programs — both process-based and thread-based — applying inter-process communication and synchronisation mechanisms provided by an operating system,
2. can use basic commands of a Unix-like operating system, combine them into pipelines and scripts.

Social competences:
1. understands that knowledge and skills related to computer science may become obsolete,
2. is aware of IT systems failures that led to major financial or social losses, or caused damage to health or even death.

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Learning outcomes presented above are verified as follows:
Lecture: Test with multiple-choice or open-ended questions with about 100 points to score and 50 points to pass.
Classes: practical assignmets and tests.

Programme content

The lecture covers the following topics:
1.
2. Definition and functions of the operating system, classification of operating systems, structure of the system software and its relationship with the hardware, the principle of operation of the system kernel.
3.
4. File system
    1.
    2. logical organisation: the definition of the file and its attributes, access methods to a file, the interface for file operations, and logical directory structure.
    3.
    4. physical organisation: disk block allocation (contiguous, chained, and indexed), free space handling (bit vector, linked list, grouping, counting), the implementation of a directory (linear list, hash table, index structure), implementation of file operations (buffer cache, the problem of integrity, concurrent access to a file).
5.
6. The overall concept of resource management and the notion of process and thread.
7.

8. Concurrency programming:
    1.
    2. concurrent programming abstraction: atomic operations and its interleaving,
    3.
    4. general correctness conditions: safety and liveness,
    5.
    6. mutual exclusion: formulation of the problem and its solution by means of atomic read and write operations on shared memory locations (Peterson's algorithm and Lamport's algorithm),
    7.
    8. architectural support: disabling interrupts, complex atomic operation (test-and-set, exchange),
    9.
    10. operating system support: binary semaphores, counting semaphores, mutex locks, conditional variables,
    11.
    12. language support: monitors, conditional critical regions,
    13.
    14. classical synchronisation problems: producer-consumer, readers-writers, dining philosophers, sleeping barber(s).
9.
10. Resource management:
    1.
    2. processor management: CPU scheduling, scheduling criteria and algorithms,
    3.
    4. memory management: memory organisation, memory allocation, creation of process image in memory, paging and segmentation, virtual memory,
    5.
    6. management of I/O devices: classification of input/output devices, the structure of the I/O mechanism, the interaction between CPU and I/O devices, buffering, and spooling.
11.
12. Deadlock: system model, resource classification, definition, necessary conditions, handling (detection, prevention, and avoidance).
13.

Laboratory classes are divided into two parts:

1.
2. Operating system usage:
    -
    - Introduction to Unix-like operating system usage: system manual, shell, and editors.
    -
    - Unix file system usage: directory structure, file operations, file types, access rights, search for files.
    -
    - Processes: priorities, signals, and management of concurrent processes.
    -
    - Interprocess communication using pipes: basic Unix filters and complex pipeline compositions.
    -
    - Bourne's shell: environment variables, redirections, aliases, script programming constructs, functions, input processing.
    -

3. Programming with the operating system kernel routines:
   -
   - Brief recapitulation of C programming in Unix-like operating systems.
   -
   - Processing file contents: file descriptors, opening files, reading and writing, implementation of simple Unix tools.
   -
   - Managing processes: process creation, running external programs, basic coordination, redirection of standard streams.
   -
   - Interprocess communication: signals, pipes, shared memory, and semaphores.
   -
   - Multithreaded programming: thread handling, synchronisation of threads (mutexes, conditional variables).
   -

Teaching methods

Lectures: presentation of slides (multimedia showcase), discussion of problems, solving tasks on blackboard.
Classes: live demonstrations, discussion, practical exercises, conducted in a computer laboratory under the control of Unix-like operating system.

Bibliography

Basic:
1. Abraham Silberschatz, Greg Gagne, Peter B. Galvin: Operating System Concepts, 10th edition, John Wiley & Sons, 2018.

Breakdown of average student's workload

	Hours	ECTS
Total workload	125	5,00
Classes requiring direct contact with the teacher	62	2,50
Student's own work (literature studies, preparation for laboratory classes/ tutorials, preparation for tests/exam, project preparation)	63	2,50
