

COURSE DESCRIPTION CARD - SYLLABUS

Course name

Mechanical Engineering Design

Course

Field of study

Management and Production Engineering

Area of study (specialization)

-

Level of study

First-cycle studies

Form of study

part-time

Year/Semester

3 / 5

Profile of study

practical

Course offered in

Polish

Requirements

compulsory

Number of hours

Lecture

18

Laboratory classes

0

Other (e.g. online)

0

Tutorials

10

Projects/seminars

0

Number of credit points

4

Lecturers

Responsible for the course/lecturer:

PhD Maciej OBST

Responsible for the course/lecturer:

-

Faculty of Mechanical Engineering

Centre of Mechatronics, Biomechanics and
Nanoengineering

Jana Pawła II 24, 60-965 Poznań, room 405

Prerequisites

Beginner student of Mechanical Engineering Design course should have mechanics, mathematics, physics and strength of materials knowledge. The student should have also creative thinking skills, should be able to find and obtain useful information from source materials, should also be ready to cooperate as student's team member.

Course objective

Learning the practical application of the principles of machine design. Getting to know the problems typical of the construction process and the practice of the constructor's work. Learning to make

decisions, solve technical problems and learn to work as a team member. Acquiring skills to use machine standards, producer's catalogs and the ability to correctly develop a mechanical project.

Course-related learning outcomes

Knowledge

The student getting knowledge about the basics of mechanical systems modeling, principles of operation and design of connections in mechanical engineering, bearings, clutches shafts and axles, basics of machine exploitation, principles of operation of mechanical gears and design methods, modern research methods used in the process of machine and structure design, principles of operation of flexible mechanical elements and design methods, basis of dynamic loads in mechanical systems. The student also gains knowledge about the practical approach to the problem of material fatigue and safety factors choosing.

Skills

The student has the ability to design machine mechanical connections, is able to use catalogs and industry standards, is able to design bearing nodes and basic mechanical constructions. The implementation of the shaft design includes dedicated calculations, selection of bearings, check calculations, fatigue calculations, design of shaft spline and splines connections, selection of seals and shaft technological parameters. The student has the ability to prepare technical documentation - executive and assembly documentation.

The Student have ability to think creatively and learn independently.

Social competences

Understanding the need for lifelong learning.

Understanding the social effects of engineering activities.

Understanding the need for team cooperation.

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Knowledge acquired as part of the lecture is verified during the exam. The exam consists of an analytical problems and theoretical part. Passing threshold: 50%.

The knowledge and skills acquired during the analytical exercises are verified based on a final test during the last activities in the semester. The test consists of 2 calculation analytical problems. Passing threshold 50%.

Programme content

Modeling of mechanical systems, basics of analytical mechanics, joints in machine design, bearings in machine design, basics of machine exploitation, basics of powertrain systems, gears - construction, principle of operation, design methods, flexible components in machine construction, experimental research in machine construction, basics of dynamics.

Calculation of welding joints, calculation of riveted and pin connections, calculation of bolted connections, strength calculation of selected construction nodes, selection of safety factors and standard connectors parts based on product catalogs. Calculation of welded, bolt and bolted by screws construction nodes for various load cases, also complex loads. Calculation of key and spline connections. Selection of standard elements. Assessment of strength safety of a selected welded structure, bolted and assembled using various joining techniques.

Teaching methods

Lecture: multimedia presentation illustrated with examples given on a board, practical problem solving.

Analytical exercises: solving technical problems, practical exercises, discussion

Project: solving practical problems, searching for sources of knowledge, teamwork, discussion

Breakdown of average student's workload

	Hours	ECTS
Total workload	100	4
Classes requiring direct contact with the teacher	30	1
Student's own work (literature studies, preparation for tutorials, preparation for tests/exam, project preparation) ¹	70	3

¹ delete or add other activities as appropriate
