

COURSE DESCRIPTION CARD - SYLLABUS

Course name

Mathematics

Course

Field of study

Management and Production Engineering

Area of study (specialization)

Level of study

First-cycle studies

Form of study

full-time

Year/Semester

1/1

Profile of study

general academic

Course offered in

Requirements

compulsory

Number of hours

Lecture

45

Laboratory classes

Other (e.g. online)

Tutorials

45

Projects/seminars

Number of credit points

5

Lecturers

Responsible for the course/lecturer:

dr inż. Kinga Cichoń

email: kinga.cichon@put.poznan.pl

ph. tel. +48 61 665 26 87

Responsible for the course/lecturer:

Faculty of Automatic Control, Robotics and
Electrical Engineering

60-965 Poznań, ul Piotrowo 3A

Prerequisites

The student should have knowledge of mathematics in the field of high school and basic scope extended by differential calculus (in the scope of extended).

Course objective

Acquainting with problems of linear algebra and learning methods and applications of differential functions of one and two variables.

Course-related learning outcomes

Knowledge

The student has knowledge of the principles of solving polynomials, exponents and roots in the set of complex numbers.

The student has knowledge of the properties of number sequences.

The student has knowledge of the derivative and how to determine it and how to use it.

The student has knowledge of matrices, methods of elementary operations on matrices, principles of solving systems of linear equations.

The student has knowledge of calculating partial derivatives of functions of many variables and the principles of determining extremes of functions of many variables.

Skills

The student is able to perform operations on complex numbers, find real and complex roots of certain types of polynomials.

The student can examine the monotonicity of sequences and calculate the limit.

The student is able to determine the derivative of a function of one variable, apply it to the limits of functions (de L'Hospital rule) and study the variability of functions.

The student can perform operations on matrices, determine the inverse matrix of elementary operations methods, calculate the determinant of matrices, solve a system of linear equations using the Gaussian elimination method.

The student is able to determine partial derivatives and local extremes of functions of many variables.

Social competences

The student is aware of the level of its knowledge in the field of energy research.

The student is aware of the deepening and expansion of knowledge in order to solve new technical problems.

The student is able to properly set priorities for the implementation of tasks specified by himself or others, including is able to think and act strictly in the area of description of processes in technical and exact sciences.

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Knowledge acquired as part of the lecture is verified by a 60-minute exam conducted in the exam session. Passing threshold: 50% of exam points and student activity during classes. Lecture for the grade.

Assessment issues based on which questions are developed. They will be sent via e-mail using the university e-mail system.

Knowledge acquired during the exercises is verified by two tests carried out during 7 and 14 classes and activity during classes. Each test consists of the same number of points. Passing threshold: 50% of points – the sum of points obtained from tests and activity during classes.

Programme content

LECTURE:

COMPLEX NUMBERS: Gaussian, trigonometric, Euler form, exponentiation and square root, polynomials.

NUMERICAL SEQUENCES: limitation, monotonicity, string boundaries, definition of the number e and its application. Criteria for convergence of numerical series.

DIFFERENTIAL ACCOUNT OF ONE VARIABLE FUNCTION: derivative of function, extrema of differentiable function, monotonicity intervals, second derivative - convexity, concavity, inflection points, derivatives of higher orders, de L'Hospital rule.

MATRIX ACCOUNT: operations on matrices, concept of inverse matrix - calculation, matrix determinant - properties and methods of determination, systems of linear equations, Kronecker-Capell theorem, solving systems of linear equations by Gauss elimination method.

DIFFERENTIAL ACCOUNT OF MULTIPLE VARIABLES FUNCTIONS: partial derivative, extremum of functions of two variables.

EXERCISES:

COMPLEX NUMBERS: Gaussian form, trigonometric form, Euler form, exponentiation and square root, polynomials.

NUMERIC SEQUENCES: monotonicity, string boundaries.

DIFFERENTIAL CALCULUS OF FUNCTIONS OF ONE VARIABLE: derivative of a function, extrema of a differentiable function, monotonicity intervals, second derivative - convexity, concavity, inflection points, derivatives of higher orders, de L'Hospital rule.

MATRIX CALCULUS: operations on matrices, calculating the determinant of a matrix, searching for an inverse matrix, solving systems of linear equations using the Gaussian elimination method.

DIFFERENTIAL ACCOUNT OF MULTIPLE VARIABLES FUNCTIONS: partial derivative, extremum of functions of two variables.

Teaching methods

Lecture: conducted using a visualizer, theory illustrated with examples. Conducted in an interactive way with the formulation of questions to a group of students. Initiating discussions during the lecture.

Exercises: solving tasks given by the teacher on the board along with analyzing the next stages. The method of solving the task by students on the board is reviewed by the tutor. Completed with tasks for independent solution at home.

Breakdown of average student's workload

	Hours	ECTS
Total workload	125	5
Classes requiring direct contact with the teacher	90	4
Student's own work (literature studies, preparation for exercises and lecture, preparation for passing the exercises and exam the lecture) ¹	35	1

¹ delete or add other activities as appropriate
