

COURSE DESCRIPTION CARD - SYLLABUS

Course name

Mathematical Analysis [S1AiR2>AM]

Course

Field of study

Automatic Control and Robotics

Year/Semester

1/1

Area of study (specialization)

–

Profile of study

general academic

Level of study

first-cycle

Course offered in

Polish

Form of study

full-time

Requirements

compulsory

Number of hours

Lecture

60

Laboratory classes

0

Other (e.g. online)

0

Tutorials

30

Projects/seminars

0

Number of credit points

6,00

Coordinators

dr inż. Zenon Zbąszyniak

zenon.zbaszyniak@put.poznan.pl

Lecturers

dr Kamila Tomaszuk

kamila.tomaszyk@put.poznan.pl

dr inż. Zenon Zbąszyniak

zenon.zbaszyniak@put.poznan.pl

mgr Malwina Mrowińska

malwina.mrowinska@put.poznan.pl

Prerequisites

Basic mathematical knowledge from secondary school. Skills of efficient evaluating of algebraic formulas. Basic knowledge of trigonometric, logarithmic and exponential functions. Efficient fraction and formulas transformation.

Course objective

Deep knowledge in mathematical logic, differential and integral calculus which is necessary to study automatic control and robotics. Skills for application of acquired knowledge to practical problems in area of technical sciences, especially automatic control and robotics.

Course-related learning outcomes

Knowledge:

1. Students know fundamental theorems in calculus and their application in practice.
2. Students have advanced knowledge in mathematical logic, set theory, sequence and series theory.
3. Students have advanced knowledge in differential and integral calculus.

Skills:

1. Students are able to present basic theorems of mathematical analysis and to apply them to solving problems illustrating concrete practical issues.
2. Students are able to use logical formalisms in order to build and analyse the simple mathematical models describing phenomena of technical disciplines.
3. Students have the ability to communicate in an understandable way (in speech and writing) mathematical reasonings and formulating theorems and definitions.
4. Students are able to apply the predicate calculus and quantifiers to solving of concrete mathematical problems.

Social competences:

1. Students are able to formulate precisely questions in order to deepen understanding of a given subject or to find the missing elements of reasoning.
2. Students have awareness of the limitations of own knowledge and understanding the need of further education in sciences technical topics.
3. Students are aware of the responsibility for own work and they are ready to adopt teamwork rules.

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Learning outcomes presented above are verified as follows:

Lecture:

Valuation of knowledge and skills during written exam. 50% credit score threshold.

Tutorials:

Two large tests concerning an application of knowledge from the lectures in exercises. Valuation of student answers during lessons.

Valuation of activity during lessons.

Programme content

Elements of logic and set theory.

Number sequences and series.

Elementary functions and their properties.

Derivative of a function of a real variable.

Properties of derivatives.

Indefinite and definite integrals with applications.

Differential calculus of functions of several variables.

Multiple integrals and their applications.

Elements of differential equations.

Course topics

Calculus of sentences and quantifiers Elements of the set theory. General theory of relations.

Equivalence and ordering relations. Infimum and supremum of sets. Sequences and their properties.

Theorems on finite and infinite limits of sequences. Subsequences. Convergence tests of series. Cauchy

product of series. Mertens Theorem. Elementary functions and their properties. Continuous functions

and their properties. Function sequences and function series. Pointwise convergence and uniform

convergence. Cauchy-Hadamard Theorem. Derivative of real function. Properties of derivatives. Mean

value theorems. First and Second Derivative Test. D'Hospitalé Theorem and its application. Derivatives

of higher order. Taylor formula and expansion of functions into exponential series. Derivatives of implicit

functions. Elementary complex functions. Indefinite integral. Fundamental methods of integration.

Geometric applications of definite integral. Differential calculus of multivariable functions. Local

extrema of functions of several variables. Directional derivative of functions of two and three variables

and its applications. Total derivative and its applications to approximate calculations. Multiple integrals

and their applications. Line integrals of a scalar and vector fields. Surface integrals. Elements of

differential equations.

Teaching methods

Lecture:

1. The lecture conducted in an interactive way with formulating questions for a group of students or for selected students.
2. The theory presented in relation to the current knowledge of students.
3. Student activity during classes is taken into account when the final grade is considered.

Tutorials:

1. Solving sample tasks on the board.
2. Detailed reviewing of task solutions and discussions with comments.
3. Initiating discussions on solutions.

Bibliography

Basic:

1. G. M. Fichtenholz, Rachunek różniczkowy i całkowy, PWN, Warszawa 2007.
2. H. J. Musielakowie, Analiza matematyczna, Wydawnictwo Naukowe UAM 2000

Additional:

1. M. Gewert. Z. Skoczylas, Analiza matematyczna 1 i 2, przykłady i zadania, Oficyna wydawnicza GiS Wrocław 2019
2. W. Kołodziej, Analiza Matematyczna, PWN, Warszawa 2009.

Breakdown of average student's workload

	Hours	ECTS
Total workload	150	6,00
Classes requiring direct contact with the teacher	92	3,50
Student's own work (literature studies, preparation for laboratory classes/ tutorials, preparation for tests/exam, project preparation)	58	2,50
