

COURSE DESCRIPTION CARD - SYLLABUS

Course name

Thermomechanics [S2EJ1>Term]

Course

Field of study

Nuclear Power Engineering

Year/Semester

1/1

Area of study (specialization)

–

Profile of study

general academic

Level of study

second-cycle

Course offered in

Polish

Form of study

full-time

Requirements

elective

Number of hours

Lecture

30

Laboratory classes

15

Other (e.g. online)

0

Tutorials

30

Projects/seminars

0

Number of credit points

5,00

Coordinators

prof. dr hab. inż. Ewa Tuliszką-Sznitko
ewa.tuliszka-sznitko@put.poznan.pl

Lecturers

Prerequisites

Mathematics: the fundamentals of differential and integral calculus, solving simple ordinary differential equations. Requirements also include fundamentals of thermodynamics, heat transfer and fluid mechanics.

Course objective

The aim of the course is to expand the student's knowledge of thermodynamics, heat transfer and fluid mechanics so that he/she can solve simple thermodynamic/flow problems occurring in nuclear power plants.

Course-related learning outcomes

Knowledge:

1. The student knows and understands the basic equations describing processes occurring in thermodynamics and fluid mechanics. Knows computational methods and knows IT tools useful for analysing work results.
2. The student efficiently uses the first and second laws of thermodynamics and the equation of state to solve the discussed thermodynamic examples. The student describes and analyses the gas and steam processes in thermodynamic cycles. The student knows the thermodynamics of moist air and the

fundamentals of thermodynamics in the field of combustion.

3. The student has the knowledge needed to identify physical phenomena occurring in simple thermodynamic systems (open and closed). The student correctly describes the energy conversion methods occurring in these systems.

4. The student is able to balance the thermal devices of a power plant: boiler, pump, cooling system, heat exchangers.

Skills:

1. The student is able to use the acquired knowledge to calculate simple (model) thermal systems of nuclear power plants.

2. The student is able to formulate hypotheses regarding the investigated thermodynamic/fluid flow problems.

Social competences:

1. The student understands the need for teamwork in solving theoretical and practical problems.

2. The student understands the need to systematically expand his/her knowledge and skills.

3. The student is aware of the need for social dialogue on matters related to the impact of nuclear energy on the environment.

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

The lecture is assessed on the basis of a written exam (90 minutes). Students answer 12 short questions. A list of all considered questions is provided during the last lecture. The exam result is determined during the oral part of the exam. Additionally, continuous assessment is performed in each class, activity and participation in discussions are rewarded. Blackboard classes are passed on the basis of the final test.

The laboratory part is assessed on the basis of reports.

Programme content

Lecture: Basic thermodynamic/flow parameters: temperature, pressure, density and velocity. Ideal gas / van der Waals gas. Heat and work, establishing signs. The first and second law of thermodynamics. Basic thermodynamic processes: isobar, isochore, isotherm, isentrope. Polytropic process. Carnot engine and Brayton engine. Water, steam, air, exhaust gases as thermodynamic fluids. Wet steam, degree of dryness, 1st and 2nd laws of thermodynamics in the area of wet steam. Rankine cycle and its optimization. Entropy/enthalpy diagram for steam, Maxwell's equations. Critical point and its importance for technology. Fundamentals of heat transfer: conduction and analytical solution of the thermal conduction equation. Forced and free convections. Complex heat transfer in a medium at boiling point. Evaporation curve (boiling crises). Condensation. Thermodynamics of wet gases. Thermodynamics of combustion processes. Thermomechanics of a compressible medium, examples. Balance of mass, momentum, energy and engineering equivalents of these equations. Open and closed systems. Engineering applications of CFD in thermomechanics.

Blackboard classes: solving examples using the 1st and 2nd laws of thermodynamics, the equations of state - an ideal and real gas models. Calculations of: model thermal cycles, selected examples of heat transfer, examples of the flows with losses.

Course topics

The importance of nuclear energy in meeting the energy needs of humanity. Flow and thermodynamic issues in nuclear power plants. The basic physical parameters used in thermomechanics, i.e. pressure, temperature, volume, mass, velocity, and their units. The conservation equations of: mass, momentum and energy, and engineering equivalents of these equations. Mass flow rate, Bernoulli equation, flow momentum equation. Calculation examples from the area of fluid mechanics. The examples of heat processes occurring in technology and nature. The ideal gas equation of state (individual gas constant, universal gas constant). Definition of work and the dissipation heat. The external reversible work and the technical reversible work. The state functions: internal energy and enthalpy. The first law of thermodynamics (closed system). The specific heat at constant pressure and specific heat at constant volume. The molar specific heat. The dependence of specific heat on temperature. Computational examples (the first law of thermodynamics and the ideal gas equation of state). The first law of

thermodynamics, open system, computational examples. The next state function: entropy. The second law of thermodynamics, entropy increase. Irreversibility of the thermodynamic processes, spontaneous processes - examples. Analysis of the basic thermodynamic processes: isobar, isochor, isotherm - examples with simple technical applications. The isentropic process. The external and technical reversible works along the isentrope. The polytropic process, polytropic heat, example - two-stage compressor with interstage cooling. The deal gas mixtures, constitutive equations (Dalton's law). Examples. The right-handed and left-handed cycles. The cycle equation and thermal efficiency of the cycle. Carnot cycle and Brayton-Joule cycle (with regeneration). The isentropic efficiency of the compression and expansion processes. Computational examples. The phase changes of water, the (s, h) diagram of wet and superheated steam. Rankine cycle - computational example. Basic thermal elements of nuclear power plants. Cooling systems and their energy balance. The thermodynamics of humid air, basic parameters: absolute humidity, relative humidity, moisture content, dew point. Mollier diagram. The technical applications: air conditioning and drying. The computational examples. Thermodynamics of the combustion process. The heat transport methods: conduction, convection and thermal radiation. Fourier's law, the thermal conductivity coefficient. The heat conduction through the flat plates and through the cylindrical pipes. The thermal conductivity equation (the solutions of chosen examples). The heat conduction with an internal energy source - examples. Newton's law, the heat transfer coefficient and its unit. Computational examples. The natural convection and forced convection. Similarity numbers: Reynolds, Prandtl, Nusselt, Grashof. The empirical dependencies on the Nusselt number - computational examples. The thermal radiation and its basic parameters (emission density, the ability of matter to reflect radiation, to absorb it and to transmit). Stefan-Boltzmann law. Emissivity. The heat exchange by radiation between two infinitely long plates perpendicular to the ground. The heat exchange by radiation between real bodies. The radiation of liquids and gases.

Engineering applications of CFD in thermomechanics. Laboratory classes: analysis of selected examples discussed during the blackboard classes using standard educational computer software.

Teaching methods

Lecture delivered remotely using synchronous access methods.

Lecture: multimedia presentation (with drawings and animations).

Blackboard classes: sample technical problems are solved on the board.

Laboratory classes: analysis of selected examples discussed during classes using educational computer software.

Breakdown of average student's workload

| | Hours | ECTS |
|---|-------|------|
| Total workload | 137 | 5,00 |
| Classes requiring direct contact with the teacher | 77 | 3,00 |
| Student's own work (literature studies, preparation for laboratory classes/ tutorials, preparation for tests/exam, project preparation) | 60 | 2,00 |
