#### **Prerequisites**

The student has basic knowledge of physics in the field of electricity.

## **Course objective**

Learning about the basics of electrical engineering in general and their detailed application in vehicles.

#### Course-related learning outcomes

Knowledge:

The student has an ordered, theoretically founded general knowledge of technology, transport systems and various means of transport.

The student knows the basic techniques, methods and tools used in the process of solving tasks in the field of transport, mainly of an engineering nature engineering.

Skills:

Student is able to make a critical analysis of the functioning of transport systems and other technical solutions and to evaluate these solutions, including: is able to effectively participate in the technical inspection and assess the transport task from the point of view of non-functional requirements, has the

ability to systematically conduct functional tests.

#### Social competences:

The student understands that in technology, knowledge and skills very quickly become obsolete. The student is aware of the importance of knowledge in solving engineering problems, knows examples and understands the causes of malfunctioning transport systems that have led to serious financial and social losses or to serious loss of health and even life.

#### Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Learning outcomes presented above are verified as follows: Test on end of semester and evaluation of reports.

### **Programme content**

Functional properties, parameters, technical solutions, methods of diagnosis and typical faults of circuit elements: power supply and start-up, classic and electronic ignition systems, electronic petrol injection systems as well as lighting and signaling systems.

Converters of non-electrical quantities into electrical quantities used in automotive systems: structure, principle of operation, parameters and methods of diagnosis.
