POZNAN UNIVERSITY OF TECHNOLOGY

EUROPEAN CREDIT TRANSFER AND ACCUMULATION SYSTEM (ECTS)

COURSE DESCRIPTION CARD - SYLLABUS

Course name

Construction project engineering in BIM [S2Bud1-IPB>PPBwBIM]

Course				
Field of study Civil Engineering		Year/Semester 1/2		
Area of study (specialization) Construction Engineering and Ma	nagement	Profile of study general academi	с	
Level of study second-cycle		Course offered in Polish	1	
Form of study full-time		Requirements compulsory		
Number of hours				
Lecture 15	Laboratory classe 30	es	Other 0	
Tutorials 30	Projects/seminar 0	S		
Number of credit points 5,00				
Coordinators dr inż. Tomasz Wiatr tomasz.wiatr@put.poznan.pl		Lecturers		

Prerequisites

Knowledge: Knowledge of building engineering, including designing of simpler building structures, and knows the basic methods of organization and planning in general construction. Skills: Knows how to make a cost estimate using the detailed method and to create a simpler network model (technological and organisational) as the basis for the schedule and its checking charts. Social competences: Possesses basic competence in the management of construction projects and demonstrates a desire to continually expand his knowledge of construction industry.

Course objective

Development of the competences of a civil engineer as a manager in the construction industry, including a buildings designer, project planner and construction manager in the context of product and process optimization, taking into account harmonization in time and space. Designing of buildings, their components and construction in terms of Open BIM with the IFC format of interoperability. Planning the project as a complex of buildings and structures as well as technical infrastructure of the construction site. Group remote working using Open BIM class CDE cloud and data in international standard formats. Component modelling of buildings and their optimisation for purposes od construction design and production process management on and off site.

Course-related learning outcomes

Knowledge

- 1. Knowledge of rules for the implementation of a investment in accordance with PM guidelines.
- 2. Knowledge of principles of managing production and logistics processes in modern construction.
- 3. Knowledge of computer methods of designing production processes in general construction.

Skills

1. Ability to identify the scope of works on the basis of classic and electronic design documentation in terms of Open BIM and conduct quantitative and qualitative analyzes of BIM models.

2. Ability to develop a general and detailed network logistic and financial schedule for the construction of a building in computer terms integrated with the cost estimate and BIM model and derivatives.

3. Ability to identify key safety and risk factors in a given production process and deal with them preventively by design methods.

Social competences

- 1. Ability to work efficiently in a construction organization observing the rules of professional ethics.
- 2. Ability to work in a team and communicate effectively on the way to achieving the project goal.
- 3. Ability to formulate conclusions on the rational improvement of construction processes.

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Checking the effects includes: a written exam from the lecture part in the form of a workshop, a written test from the auditorium part and an assessment of the laboratory and project elaboration, taking into account consulting activity and additionally attendance at classes.

Programme content

With a key division into lecture (theory and methods overview), audit exercises (analytical methods and analysis examples), laboratories (problem work with software) as complementary parts. The basis is an investment project involving the construction of a large residential development comprising 10 repetitive residential buildings, 10 non-residential buildings of various types, several above- and below-ground structures, plant for multidimensional prefabricated elements and concrete mixture as well as permanent and temporary facilities. The link is made by the audit exercises which combine a complex problem from the laboratory part with the separated issues, which the enriches the lecture with complementary themes. The lecture culminates in an examination that relates to the overall knowledge presented in all parts of the course.

Course topics

Project in building engineering, construction phase as the purpose of design documentation, information about the building in terms of Open BIM with IFC format. Designing of building structures, classification and technical specifications of components. Model quantification and take-offs, conversion of construction product information into production processes. Estimation and data analysis in terms of BIM with analyzes of active and passive resources as well as fixed and variable costs. Two-point network models in a deterministic approach and the basics of risk analysis in a probabilistic approach of the PERT method. Material and financial schedule of construction in terms of 5D BIM and derivatives, harmonization with the method of flow work divided into working packages in terms of 4D BIM. Safety and health plan integrated with the 4D BIM construction phase model. Construction logistics, planning of deliveries, consumption and stock as well as transport.

Teaching methods

- 1. Lecture: slide and projector presentations, oral explanations, sketches and software demonstrations.
- 2. Tutorials: graphical and analytical methods, as well examples supporting the laboratory work.
- 3. Laboratories: work in computer laboratory, practical designing problems in planning process.

Breakdown of average student's workload

	Hours	ECTS
Total workload	125	5,00
Classes requiring direct contact with the teacher	77	3,00
Student's own work (literature studies, preparation for laboratory classes/ tutorials, preparation for tests/exam, project preparation)	48	2,00
