

COURSE DESCRIPTION CARD - SYLLABUS

Course name

Building engineering (study visit in industry company) [S2Bud1E-KB>B(WSwP)]

Course

Field of study

Civil Engineering

Year/Semester

1/2

Area of study (specialization)

Structural Engineering

Profile of study

general academic

Level of study

second-cycle

Course offered in

English

Form of study

full-time

Requirements

compulsory

Number of hours

Lecture

15

Laboratory classes

0

Other

0

Tutorials

30

Projects/seminars

0

Number of credit points

2,00

Coordinators

dr inż. Marlena Kucz prof. PP
marlena.kucz@put.poznan.pl

Lecturers

Prerequisites

The student should have knowledge of building materials, general construction, building physics, basics of energy-saving construction. Knowledge of a foreign language enabling the study of world literature in the field of study

Course objective

Mastering knowledge in the field of sustainable construction, including legal regulations. Acquainting with the subject of communication construction, including sustainable transport. Performing calculations of energy demand for a selected building. Consolidation of the principles of designing energy-efficient buildings Sensitivity to ecological problems in architecture and construction. Understanding the impact of the construction, material and technological solutions used in the building on the natural environment.

Course-related learning outcomes

Knowledge:

have detailed and theoretically based knowledge in the field of building physics, related to heat and moisture migration in selected building units

have detailed knowledge of the impact of building investments on the environment and understand the

need to implement the rules of sustainable development
know in detail the Act of Building Law, standards and recommendations for building unit design: Polish standards (PN) and European standards (EN) as well as the technical conditions of constructing selected building units.

Skills:

is able to include correct technical solutions in the building design, taking into account sustainable development and perform calculations of energy demand. Also is able to select materials and technologies for the implementation of traditional, ecological, sustainable and energy-saving construction in complex conditions

is able to prepare a design of a building object and prepare technical documentation in the environment of selected programs, for example Sketch up

are able to obtain information from literature, databases and other properly selected information sources; can integrate the obtained information, interpret and evaluate it as well as draw conclusions, formulate, justify, discuss and present opinions

acquiring the ability to distinguish and correctly name different types of construction: sustainable, environmentally friendly and energy-efficient

Social competences:

are aware how important is sustainable development in building engineering

understand the need to transfer to the society the knowledge about building engineering, transfer the knowledge in a clear and easily comprehensible manner

are ready to autonomously complete and broaden (extend) knowledge in the field of modern processes and technologies of building engineering

can realise that it is necessary to improve professional and personal competence; are ready to critically evaluate the knowledge and received content

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Learning outcomes presented above are verified as follows:

Written test, project evaluation, written and oral exam.

319 / 5 000

Lecture Grading scale based on points:

91-100 very good (A) 81 - 90 good plus (B) 71 - 80 good (C) 61 - 70 satisfactory plus

(D) 51 - 60 satisfactory (E) below 50 insufficient (F)

Exercises:

performing calculations for a selected building - energy demand (min. 3 variants) - weight 60%

Programme content

The importance of Sustainable Development in construction. Environmental Certificates and Eco-labels. Sustainable development goals. Sick building syndrome. The issue of selecting the properties of building materials/products in the environmental aspect. Pro-ecological construction and material solutions for buildings.

Course topics

Equations of motion of structures treated as discrete systems. Equations of motion written in terms of state variables. Models of chosen types of structures. Damping models. Free vibration analysis, dynamic characteristics of structures with and without damping. Sensitivities of natural frequencies and modes of vibration with respect to design parameters. Analysis of steady state vibration. Normal coordinates and their applications. Rayleigh quotients. Computer methods of solution of eigenvalue problems. Time integration methods. Dynamic analysis of block foundations. Tuned mass damper. Analysis of structures seismically and para-seismically excited.

Teaching methods

Monographic lecture, blackboard exercises, correction of project exercises

Breakdown of average student's workload

	Hours	ECTS
Total workload	60	2,00
Classes requiring direct contact with the teacher	45	1,50
Student's own work (literature studies, preparation for laboratory classes/ tutorials, preparation for tests/exam, project preparation)	15	0,50
