# COURSE DESCRIPTION CARD - SYLLABUS

**Course name**
Statistics in electric power engineering [N2Elenerg1>SwE]

## Course

Field of study
**Electrical Power Engineering**

Year/Semester
**1/2**

Area of study (specialization)
**Smart Grids**

Profile of study
**general academic**

Level of study
**second-cycle**

Course offered in
**Polish**

Form of study
**part-time**

Requirements
**compulsory**

## Number of hours

Lecture
**10**

Laboratory classes
**10**

Other
**0**

Tutorials
**0**

Projects/seminars
**0**

## Number of credit points

**2,00**

## Coordinators

dr Ewa Bakinowska
ewa.bakinowska@put.poznan.pl

## Lecturers

## Prerequisites

The student has basic knowledge of combinatorics and probability calculus resulting from the school curriculum. The student has basic knowledge of mathematical analysis (differential calculus of functions of one variable, differential calculus of functions of several variables, integral calculus of functions of one variable and the basics of matrix algebra). He can operate a computer. Can think logically. The student is aware of the purpose of learning

## Course objective

The aim of the course is to familiarize students with selected problems of statistics. Students acquire the ability to use probabilistic and statistical methods to describe technical issues.

## Course-related learning outcomes

Knowledge:
the student knows various methods of statistical inference, including estimation of paramatres and testing statistical hypotheses. knows how to use them in solving technical problems, including power problems. has ordered and theoretically founded knowledge in the field of statistical analyzes supported by computer software: knows the basics of software used for statistical calculations (r

program).

Skills:
the student is able to use the methods and tools of mathematical statistics and software r in engineering practice, in solving technical problems.
he can analyze and forecast the effects of activities in the light of technical and environmental conditions.

Social competences:
the student is able to think and act in a creative and entrepreneurial manner; understands the need for actions to make the society aware of the development of the power industry, but also to reduce the risks it carries.

## Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Learning outcomes presented above are verified as follows:
Lecture: Assessment of knowledge and skills acquired during the lecture is verified on the basis of a written test.
Laboratories: The assessment of knowledge and skills acquired in laboratories is verified on the basis of written test.

## Programme content

1. Discrete random variable.
2. Continuous random variable.
3. Elements of descriptive statistics.
4. Covariance of sample and sample linear correlation coefficient. Linear regression.
5. Point estimation. Confidence intervals.
6. Tests of significance (parametric)

## Course topics

LECTURE:
1. Random variable. Expected value. Variance. Cumulative distribution function.
2. Discrete random variable. Discrete distributions.
3. Continuous random variable. Continuous distributions.
4. Elements of descriptive statistics. Location measures and dispersion measures from the sample.
5. Covariance and linear correlation coefficient from the sample. Linear Regression.
6. Point estimation. Interval estimation.
7. Significance tests (parametric). One population and two populations.
LABORATORIES:
1. Discrete random variable. Binomial distribution, Poisson distribution.
2. Continuous random variable. Normal distribution.
3. Elements of descriptive statistics. Location measures and dispersion measures from the sample.
4. Covariance and linear correlation coefficient from the sample. Linear Regression.
5. Parametric Hypothesis Testing - One Population
6. Parametric Hypothesis Testing - Two Populations

## Teaching methods

A lecture with a multimedia presentation supplemented with many examples. Interactive lecture with the formulation of current questions to a group of students. Students actively participate in the lecture. Each presentation of a new topic is preceded by a reminder of the content related to the discussed issue (content known to students from other subjects).
Laboratories: All students throughout the year receive an electronic list of tasks that are solved in the laboratories. The needed theory, formulas and graphs are provided electronically. The tasks are solved by students using the R software, with the active participation of the students.

## Breakdown of average student's workload

|  | Hours | ECTS |
|---|---|---|
| Total workload | 50 | 2,00 |
| Classes requiring direct contact with the teacher | 20 | 1,00 |
| Student's own work (literature studies, preparation for laboratory classes/ tutorials, preparation for tests/exam, project preparation) | 30 | 1,00 |
