POZNAN UNIVERSITY OF TECHNOLOGY

EUROPEAN CREDIT TRANSFER AND ACCUMULATION SYSTEM (ECTS)

COURSE DESCRIPTION CARD - SYLLABUS

Course name

Smart data processing and management [S2Elmob1>IPiZD]

Course			
Field of study Electromobility		Year/Semester 1/1	
Area of study (specialization)		Profile of study general academic	
Level of study second-cycle		Course offered in Polish	
Form of study full-time		Requirements compulsory	
Number of hours			
Lecture 15	Laboratory classe 15	es	Other 0
Tutorials 0	Projects/seminars 0	6	
Number of credit points 2,00			
Coordinators dr inż. Piotr Kuwałek piotr.kuwalek@put.poznan.pl		Lecturers	

Prerequisites

Student should have basic knowledge of mathematics, electrical engineering and programming basics, as well as the ability to work in a laboratory group. Student should also have the ability to in-depth understanding and interpretation of the informations and effective self-education in the field related to the selected field of study. Student should be aware of the need to expand their competences and should be ready to cooperate as part of the team.

Course objective

Increase of the student's knowledge of general signal theory, including advanced signal processing algorithms used in the expert systems. The student's understanding of the limitations of digital signal processing resulting from, e.g., from aliasing, spectrum leakage, problem of recreation of signal from samples. Increase of the student's knowledge in the field of signal analysis tools in the time, frequency, time and frequency domains. Increase of the student's knowledge in the field of filter design. Improvement practical skills in using engineering tools in signal processing.

Course-related learning outcomes

Knowledge:

1. Student has extended and in-depth knowledge of selected areas of mathematics necessary to describe the elements and systems used in electromobility.

2. Student has a theoretically based knowledge of modern methods of data processing and analysis, also in the field of machine learning.

3. Student has extended practical knowledge of advanced methods of signal processing and analysis of measurement data.

Skills:

1. Student is able to use modern information and communication tools, advanced programming techniques and machine learning methods when processing and analyzing data.

2. Student is able to integrate knowledge from various sources and related disciplines.

3. Student is able to determine the directions of further learning and organize the process of selfeducation.

Social competences:

1. Student is aware of the importance of the latest scientific and technical achievements in solving research and practical problems and, if necessary, supporting themselves with expert opinions.

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Lecture:

evaluation of knowledge and skills by tests. The test pass threshold is 50%. Considering activities of students in the laboratory classes as well as lectures.

Laboratory:

The skills obtained during the laboratory exercises are verified either on the basis of reports made by students at home after the exercises, or on the basis of an application prepared in a selected environment, in which advanced methods for signal processing learned during the classes are

implemented. Exercises are held in a parallel form. During the laboratory classes, verbal preparation of students for the exercise is verified. Completion the laboratory classes requires the completion of all exercises and individual implementation indicated reports or applications with indicated functionalities.

Programme content

The program content covered in lectures is related to:

- conventional data processing methods;

- modern advanced data processing techniques that take into account automatic adaptation (so-called smart data processing methods);

- analyzing data exhibiting additive features, i.e. multidimensional multiresolution signal analysis;

- analyzing data exhibiting multiplicative features and functional compositions, i.e. issues related to demodulation;

- using machine learning methods for data processing.

The program content covered in laboratory classes is closely related to the program content presented in lecture classes. Laboratory classes present the possibilities of using modern programming languages for data analysis using advanced data processing techniques (so-called smart data processing methods). During laboratory classes, students become familiar with the conceptual operation of selected methods and learn about their limitations in practical applications.

Course topics

Lecture:

L1: General elements of signal theory.

L2: Analysis of stationary and non-stationary signals. Time-frequency analysis using wavelet analysis - CWT and DWT.

L3: Signal correlation analysis. Selected advanced methods of fundamental frequency estimation.

L4: Selected problems of filtering discrete signals. Advanced statistical filters. The problem of signal decomposition and multi-resolution signal analysis.

L5: Modulation model as an element of diagnostics.

L6: Basics of machine learning. Supervised and unsupervised learning. Selected methods of clustering.

L7: Supporting data processing and management using artificial intelligence methods.

Laboratory:

Lab1: OHS + introduction to Matlab/Python.

Lab2: Introduction to Matlab/Python.

Lab3: Determination of selected signal parameters.

Lab4: Determination of the fundamental frequency of the signal using advanced estimation techniques for this parameter.

Lab5: Construction of advanced statistical filters.

Lab6: Multi-resolution analysis of signals using advanced signal processing techniques.

Lab7: Data processing and management using artificial intelligence methods.

Teaching methods

Lecture: Multimedia presentations (including figures, photos, videos) with examples given on the blackboard. Theoretical issues are presented in close connection with practice. Lecture conducted on-line with using synchronous access methods.

Laboratory: carrying out laboratory exercises individually or in small teams (implementation of signal processing methods, use of engineering signal processing tools) with the help and supervision of the teacher.

Breakdown of average student's workload

	Hours	ECTS
Total workload	55	2,00
Classes requiring direct contact with the teacher	30	1,00
Student's own work (literature studies, preparation for laboratory classes/ tutorials, preparation for tests/exam, project preparation)	25	1,00
