POZNAN UNIVERSITY OF TECHNOLOGY

EUROPEAN CREDIT TRANSFER AND ACCUMULATION SYSTEM (ECTS)

COURSE DESCRIPTION CARD - SYLLABUS

Course name

Programmable digital systems [S2EiT2E-TIT>PSC]

Coordinators		Lootaroro	
		Lecturers	
Number of credit points 3,00			
Tutorials 0	Projects/seminar 0	S	
Number of hours Lecture 15	Laboratory class 30	es	Other 0
Form of study full-time		Requirements compulsory	
Level of study second-cycle		Course offered ir English	ſ
Area of study (specialization) Information and Communication Te	echnologies	Profile of study general academi	ic
Field of study Electronics and Telecommunication	ns	Year/Semester 2/3	

Prerequisites

Has Has a basic knowledge of Boolean algebra. Has a knowledge in area of programming in C / C + +. Has a general knowledge about combinational and sequential digital circuits. Has a general knowledge in area of binary arithmetic and digital representation of signals. Is able to look for information required during design process and take educational courses, if needed, especially through Internet and distance education. Knows the limitations of their own knowledge and skills; can precisely formulate questions; understands the need for further education and systematic reading of scietnific journals in the field. Can work individually and in team; knows the responsibility for tasked realized in team.

Course objective

The main purpose of the course is to show various design technics for digital systems that can be suitable for FPGA devices. As hardware description language the Verilog will be used. A lot of examples will show how to efficiently use all basic and generic FPGA blocks (like RAM, DSP, etc.). Laboratory work will be performed with exploiting FPGA boards.

Course-related learning outcomes

Knowledge:

Student has a basic skill in design of simple digital devices.

Student has a basic knowledge about the principle of operation of fast communication interfaces. Student has a basic knowledge about designing a state machines.

Skills:

Can describe complex digital system as a hierarchy of modules using Verilog language. Can correctly determine the parameters of the interface between the two frequency domains. Can acquire data from the literature and other sources, can integrate the information, make their interpretation, as well as formulate and to justify opinions.

Social competences:

Can see and analyze development of design techniques. Ability of self-learning (textbooks, computer programs).

Knowing the responsibility for the electronic and telecommunication systems being designed.

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Learning outcomes presented above are verified as follows:

Lecture: written exam

The written exam is a set of 6-10 problematic questions, for which desciptory answer is expected. Each answer is ranked from 0 to 1 points (fractinal points also possible).

The exam is passed if the number of attained points is greater than 50%. More than 50% indicates the knowledge above of satisfactory level.

The course issues of which the questions are prepared, are sent to students by e-mail using the university"s e-mail system.

Laboratories:

Activity during classes, reports from particular activities. Laboratory project realized individually/in small groups.

Programme content

Lecture:

Introduction to digital programmable devices. FPGA devices. Basic embedded blocks (RAM, PLL, FIFO, etc.). Comparison of different FPGA devices. Inter-domain communication (source-synchronous interface). System-onChip (SoC). Communication s interfaces and buses. Design and synthesis methods for FPGA devices. Survey of high level hardware description languages.

Laboratories:

Simulation and synthesis framework and software. Basic testbenches. Design of various modules: random number generators. binary coded decimals converter, buffer modules (e.g. stack, fifo), arithmetic logic units, state machines. Design of a system comprising state machines, e.g. demonstration of traffic lights, or equation calculator in infix/postfix notation.

Course topics

none

Teaching methods

Lecture: multimedia presentation with examples presented on the blackboard. Laboratories: work on computers with simulation and synthesis software. Usage of FPGA boards. Examples illustrated on screen/blackboard.

Breakdown of average student's workload

	Hours	ECTS
Total workload	90	3,00
Classes requiring direct contact with the teacher	55	2,00
Student's own work (literature studies, preparation for laboratory classes/ tutorials, preparation for tests/exam, project preparation)	35	1,00
