

COURSE DESCRIPTION CARD - SYLLABUS

Course name

Organization auxiliary processes [N1IBiJ1>OPPom]

Course

Field of study

Safety and Quality Engineering

Year/Semester

3/5

Area of study (specialization)

–

Profile of study

general academic

Level of study

first-cycle

Course offered in

Polish

Form of study

part-time

Requirements

elective

Number of hours

Lecture

9

Laboratory classes

0

Other

0

Tutorials

18

Projects/seminars

9

Number of credit points

4,00

Coordinators

dr hab. inż. Małgorzata Jasiulewicz-Kaczmarek

prof. PP

malgorzata.jasiulewicz-kaczmarek@put.poznan.pl

Lecturers

Prerequisites

The student starting this subject should have knowledge of the basics of business operations, design of technological processes, basics of machine construction and organization of production. He should also be able to obtain information from sources indicated by the teacher and be ready to cooperate within a team.

Course objective

Acquiring by the student the knowledge (systematics and methodology) needed to shape processes supporting the implementation of basic processes in the enterprise

Course-related learning outcomes

Knowledge:

1. Knows concepts of technical safety, safety systems, Occupational Health and Safety and problems of hazards and their consequences [K1_W02].
2. Knows advanced knowledge about concepts of the life cycle of industrial products and life cycle of objects, systems and technical systems [K1_W06].
3. Knows advanced knowledge about concepts of engineering management in the field of product and

process [K1_W07].

4. Knows the fundamental problems of modern civilization and development trends as well as best practices [K1_W10].

Skills:

1. Is able to communicate using appropriately selected resources in a professional environment and in other environments [K1_U02].

2. Is able to make a critical analysis of the way it functions and assess - in conjunction with Safety Engineering - existing technical solutions, in particular machines, devices, objects, systems, processes and services [K1_U06].

3. Can design an object, system or process that meets the requirements of safety engineering using appropriate methods and techniques and make a preliminary economic assessment [K1_U07].

4. Is able to identify changes in requirements, standards, regulations and technical progress and the reality of the labor market, and based on them determine the needs of supplementing knowledge [K1_U12].

Social competences:

1. Is aware of the importance of knowledge in solving cognitive and practical problems in the scope of safety engineering and continuous improvement of the knowledge [K1_K02].

2. Is aware of responsibility for own work and readiness to comply with the rules of working in a team and taking responsibility for the tasks carried out jointly [K1_K07].

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Knowledge acquired during the lecture is verified on an ongoing basis during classes, through short exercises performed during the lecture, and based on one test (about 30 minutes) at the last lecture. Tests consist of 20-30 (test) questions, scored on a two-point scale of 0, 1. Passing threshold: 50% of points. Assessment issues on the basis of which questions are prepared are based on the content provided to students during lectures, and additional materials indicated by the teacher.

Skills acquired as part of the tutorials are verified on an ongoing basis based on the tasks performed by the students during the classes.

Skills acquired during design classes are verified on an ongoing basis based on the progress of design work, at the end of classes based on the completed design task and its presentation on the forum

Programme content

The program covers theoretical and practical issues regarding the functioning of supporting processes in the enterprise

Course topics

The lecture program covers the following topics:

1) Maintenance: a) reliability functions, systems, methods, principles of operation of technical facilities and workshop tools and aids; b) maintenance throughout the life cycle of the machine; c) trends towards improving the process of operating technical systems (TPM, RCM, Maintenance 4.0); d) management of spare parts and consumables; e) measures and indicators for assessing the effectiveness of technical facilities and maintenance services.

2) Warehouse management: a) functions and types of warehouses, b) warehousing program and warehouse size, c) means of transport and warehouse equipment, d) functional and spatial systems warehouses, storage methods; e) classification and technical solutions of transport systems in warehouses; f) organization of warehouse work.

The exercise program covers the following topics:

Calculation of KPIs (e.g. MTBF, MTTR, ...), analysis of an emergency event, reporting of an emergency event by the operator, instructions for replacing parts by a technical department employee/operator (e.g. OPL), checklist for accepting the machine after repair, selection of means of transport and warehouse equipment, warehouse operation manual

The project program includes the following issues: Designing a selected element of the support process (maintenance, warehouse management)

Teaching methods

- 1) Lecture: multimedia presentation, illustrated with examples on the board.
- 2) Exercises: multimedia presentation illustrated with examples given on a blackboard and performance of tasks given by the teacher - practical exercises.
- 3) Project: discussion of proposals for solutions to design issues and presentation on the forum

Breakdown of average student's workload

	Hours	ECTS
Total workload	100	4,00
Classes requiring direct contact with the teacher	39	1,50
Student's own work (literature studies, preparation for laboratory classes/ tutorials, preparation for tests/exam, project preparation)	61	2,50
