# POZNAN UNIVERSITY OF TECHNOLOGY

#### EUROPEAN CREDIT TRANSFER AND ACCUMULATION SYSTEM (ECTS)

# **COURSE DESCRIPTION CARD - SYLLABUS**

Course name

Design of Production Systems [S1IZarz1>PSP]

Course			
Field of study Engineering Management		Year/Semester 4/7	
Area of study (specialization)		Profile of study general academi	ic
Level of study first-cycle		Course offered in Polish	n
Form of study full-time		Requirements elective	
Number of hours			
Lecture 15	Laboratory classe 0	es	Other 0
Tutorials 0	Projects/seminars 15	6	
Number of credit points 3,00			
Coordinators	ordinators Lecturers		
dr inż. Ireneusz Gania ireneusz.gania@put.poznan.pl			

#### **Prerequisites**

The student starting this subject should have basic knowledge in the field of production and service management, should be able to apply the tools and techniques of designing production units of the first degree of complexity, should also be able to obtain information from the indicated sources and be willing to cooperate within a team.

### Course objective

To provide students with basic theoretical and practical knowledge related to the design of production systems as well as basic methods and techniques used in this process.

#### Course-related learning outcomes

Knowledge:

The student classifies and analyzes various types of organizational structures and applies methods of their design, in the context of creating effective production systems [P6S\_WG\_06].

The student identifies the phases of the life cycle of socio-technical systems and their impact on the design of production systems [P6S\_WG\_13].

The student analyzes and assesses typical industrial technologies, with particular emphasis on

technologies for construction and operation of machinery [P6S\_WG\_17]. The student explains the basic principles of safety and hygiene at work, applying them to the industrial environment [P6S\_WG\_18].

Skills:

The student conducts experiments, measurements, and computer simulations, analyzing results in the context of designing production systems [P6S\_UW\_09].

The student applies analytical and experimental methods to design production systems, including simulations and modeling [P6S\_UW\_10].

The student designs the structure and technology of simple parts and subassemblies of machinery, considering organizational and technical aspects of production [P6S\_UW\_16].

Social competences:

The student develops and implements design strategies, considering technical, economic, marketing, legal, organizational, and financial aspects [P6S\_KO\_02].

The student analyzes and assesses the effects of engineering activities, including their impact on the environment, taking responsibility for the decisions made [P6S\_KR\_01].

### Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Formative assessment:

a) in the scope of projects - based on the current progress of project task implementation

b) in terms of lectures based on answers to questions about the material discussed in previous lectures, half test.

Summative rating:

a) in the scope of projects based on the presentation of the implementation of the project task and answers to questions regarding the implementation of the project task and solutions used in the project task

b) in the scope of lectures (1) written exam in the field of lecture content; each question is scored on a scale of 0 to 1; the exam is passed after obtaining at least 60% of the points; the student can take the exam after passing the project; (2) discussion of exam results

## Programme content

Enterprice. Determining the design situation (modernization or design of new systems). Algorithm for designing technical and economic assumptions. Project

documentation.. New directions and trends in the design of production systems.

### **Course topics**

Lecture: Basics of production system design. Enterprise as a system. Determining the design situation (modernization or design of new systems). Product implementation process. Algorithm for designing technical and economic assumptions for the preparation of product manufacture. Design issues: production system structures, production launch, spatial organization of production processes. Project documentation. General plan, location of the enterprise. System design assessment. New directions and trends in the design of production systems. Robotization. Automation in production systems. Project: Separation of complexity level I production units with the use of IT tools Parametric characteristics of separate production units with an index evaluation. Analysis of separated production units, selection of the number of positions, calculation of the number of employees, evaluation of effectiveness. Calculation of the number of non-productive workers of the designed production system. Calculation of the area of the designed production system, with the division into production and auxiliary area. Designing support services and economies (tools, renovation, material and storage, transport, quality control) in terms of the organizational structure, planned tasks, tools and methods used. Development of the organizational structure of the designed production system and the production department Distribution of the designed system of production units and auxiliary economies in the production hall on a scale of 1: 100.

## **Teaching methods**

- Informative (conventional) lecture (information transfer in a systematic way) of a monographic nature,

in the form of a multimedia presentation.

- Project method (individual or team implementation of a large, multi-stage cognitive or practical task, the effect of which is the creation of a work).

#### Breakdown of average student's workload

	Hours	ECTS
Total workload	75	3,00
Classes requiring direct contact with the teacher	30	1,00
Student's own work (literature studies, preparation for laboratory classes/ tutorials, preparation for tests/exam, project preparation)	45	2,00
