COURSE DESCRIPTION CARD - SYLLABUS

Course name
Mathematics [N1ZiIP2>MAT2]

Course

Field of study
Management and Production Engineering

Year/Semester
1/2

Area of study (specialization)
–

Profile of study
general academic

Level of study
first-cycle

Course offered in
Polish

Form of study
part-time

Requirements
compulsory

Number of hours

Lecture
16

Laboratory classes
0

Other
0

Tutorials
24

Projects/seminars
0

Number of credit points

6,00

Coordinators

Lecturers

Prerequisites

The student should have knowledge of complex numbers, matrix calculus and its application, differential functions of one and two variables in the first semester.

Course objective

Acquainting with problems of differential and integral calculus of functions of many variables and ordinary differential equations. Developing students" skills to solve simple mathematical problems by using different types of equations.

Course-related learning outcomes

Knowledge:
The student has knowledge of indefinite and definite integrals and calculation methods.
The student has knowledge of the multiple integral and knows how to calculate it.
The student has knowledge of the type of ordinary differential equations and methods of solving them.
The student has knowledge of the Laplace transform and its application to differential equations.
The student has knowledge of scalar, vector and mixed products.

Skills:
The student is able to calculate the definite integral, determine the area, curve arc length, volume and

surface area of a rotational solid.
The student is able to calculate multiple integrals in Cartesian and polar coordinates.
The student can recognize the type and solve the ordinary differential equation.
The student can apply the Laplace transform in differential equations.
The student can apply products in space.

Social competences:
The student is aware of the level of its knowledge in the field of aviation engineering research.
The student is aware of the deepening and expansion of knowledge in order to solve new technical problems.
The student is able to properly set priorities for the implementation of tasks specified by himself or others, including is able to think and act strictly in the area of description of processes in technical and exact sciences.

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Learning outcomes presented above are verified as follows:
Knowledge acquired as part of the lecture is verified by a 60-minute exam conducted in the exam session. Passing threshold: 50% of exam points and student activity during classes. Lecture for the grade. Exam issues, on the basis of which questions are developed. They will be sent via e-mail using the university e-mail system.
Knowledge acquired during the exercises is verified by 4-5 tests and activity during classes. Passing threshold: 50% of points the sum of points obtained from tests.
Assignment of grades to percentage ranges of results: <90-100> very good; <80-90) good plus; <70-80) good; <60-70) satisfactory plus; <50-60) satisfactory; <0-50) unsatisfactory.

Programme content

Integral calculus of one variable functions. Defined integral. Multi-dimensional integral. Ordinary differential equations I and II order. Laplace transformation.

Course topics

LECTURE:
INTEGRAL CALCULUS OF FUNCTIONS OF ONE VARIABLES: indefinite integral - basic methods of integration and integration of faithful, irrational and trigonometric functions.
DEFINED INTEGRAL: Riemann integral and its application and improper integrals.
MULTI-DIMENSIONAL INTEGRAL: calculating, exchanging the order of integration of two variables integral for polar coordinates, the use of double integral in Cartesian and polar coordinates.
ORDINARY DIFFERENTIAL EQUATIONS: definition of ordinary differential equation, general and special solution, with separated variables, 1st order linear differential equation, complete equation, Bernoulli equation, 2nd order linear differential equation with constant coefficients.
LAPLACE TRANSFORMATION: definition of the Laplace transformation and its application for solving differential equations.
SPACE GEOMETRY: scalar, vector and mixed product definition and their application.
EXERCISES:
INTEGRAL CALCULUS OF FUNCTIONS OF ONE VARIABLES: indefinite integral - basic methods of integration and integration of functions: faithful, irrational and trigonometric.
DEFINED INTEGRAL: Riemann integral and its application and improper integrals.
MULTI-DIMENSIONAL INTEGRAL: normal area, double integral - calculation, conversion of integration order, conversion of variables in double integral to polar coordinates, use of double integral in Cartesian and polar coordinates.
ORDINARY DIFFERENTIAL EQUATIONS: ordinary differential equations with separated variables, homogeneous equation, ordinary heterogeneous 1st order linear differential equation, 2nd order ordinary differential heterogeneous equation with constant coefficients.

Teaching methods

Lecture: conducted using a visualizer, theory illustrated with examples. Conducted in an interactive way with the formulation of questions to a group of students. Initiating discussions during the lecture.

Exercises: solving tasks given by the teacher on the board along with analyzing the next stages. The method of solving the task by students on the board is reviewed by the tutor. Completed with tasks for independent solution at home.

Breakdown of average student's workload

	Hours	ECTS
Total workload	150	6,00
Classes requiring direct contact with the teacher	42	2,00
Student's own work (literature studies, preparation for laboratory classes/ tutorials, preparation for tests/exam, project preparation)	108	4,00
