

COURSE DESCRIPTION CARD - SYLLABUS

Course name

Advanced identification methods for control systems [N2AiR1-ISA>PO1-ZMISA]

Course

Field of study	Year/Semester
Automatic Control and Robotics	1/2
Area of study (specialization)	Profile of study
Intelligent Control Systems	general academic
Level of study	Course offered in
second-cycle	Polish
Form of study	Requirements
part-time	elective

Number of hours

Lecture	Laboratory classes	Other
10	20	0
Tutorials	Projects/seminars	
0	0	

Number of credit points

3,00

Coordinators

dr inż. Jacek Michalski
jacek.michalski@put.poznan.pl

Lecturers

Prerequisites

Every student attending the subject is expected to have the knowledge and skill in automatic control basics. Every student should also have basic knowledge of nonparametric and parametric identification of simple linear systems, both deterministic and stochastic.

Course objective

To extend student knowledge about system identification with issues concerning multivariable and nonlinear systems. To provide students with the knowledge of control algorithms relying on the models obtained through system identification and dealing with the identifiability problems in such control systems.

Course-related learning outcomes

Knowledge

[K2_W5]

[K2_W10, K2_W3]

Skills

[K2_U10]

[K2_U21]

[K2_U27, K2_U12]
Social competences
[K2_K4]

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Learning outcomes presented above are verified as follows:

The knowledge gained during lectures is verified by the final test consisting of 20-40 closed questions.

The skills acquired during laboratory classes is verified by: written tests, knowledge and skills assessment during excersises made by students, evaluation of the reports, which are prepared individually by students.

Programme content

Identifiability problems of systems described using transfer functions or state-space equations. System identification methods for multiple-input/multiple-output (MIMO) systems: relying on decomposition to MISO or SIMO subsystems and relying on state-space representation - subspace methods. Problem of minimum realization and Hankel matrix decomposition. Identification algorithms for nonlinear systems. Control methods utilising system identifocation and identifiability problems in such systems.

Course topics

none

Teaching methods

1. Lectures: interactive presentation supplemented by examples calculated on the blackboard. Students are encouraged to active participation in the classes.

2. Laboratory classes: practice excercises performed by students on computers, according to the instruction given by a teacher. Students are encouraged to independent thinking, analysis and solving problems arising in advanced system identification.

Breakdown of average student's workload

	Hours	ECTS
Total workload	75	3,00
Classes requiring direct contact with the teacher	30	1,50
Student's own work (literature studies, preparation for laboratory classes/ tutorials, preparation for tests/exam, project preparation)	45	1,50
