

COURSE DESCRIPTION CARD - SYLLABUS

Course name

Fluid Mechanics II [S2IŚrod2>MP]

Course

Field of study

Environmental Engineering

Year/Semester

1/1

Area of study (specialization)

Water Supply, Water and Soil Protection

Profile of study

general academic

Level of study

second-cycle

Course offered in

Polish

Form of study

full-time

Requirements

compulsory

Number of hours

Lecture

30

Laboratory classes

15

Other

0

Tutorials

15

Projects/seminars

0

Number of credit points

4,00

Coordinators

dr inż. Ilona Rzeźnik

ilona.rzeznik@put.poznan.pl

Lecturers

Prerequisites

1. Knowledge Mathematics: differential and integral calculus, ordinary and partial differential equations, combinatorics and calculus of probability, basic numerical methods. Classical physics: foundations of fluid mechanics and heat engineering. 2. Skills Mathematics: the use of differential and integral calculus to calculate physical phenomena, solving ordinary differential equations and simple partial differential equations, solving differential equations by means of numerical methods Fluid mechanics and heat engineering: solving fluid statics, kinematics and dynamics problems and making fluid mechanics measurements, solving heat engineering problems at the first-cycle level. 3. Social competencies Awareness of the need of constantly update and permanently supplement knowledge and skills

Course objective

Assumptions and objectives of the course: Extending and deepening the knowledge and skills in fluid mechanics required to solve complex fluid flow problems appear both in built and natural environment

Course-related learning outcomes

Knowledge:

1. The student has structured and theoretically extended knowledge of the kinematics of

turbomachinery blading systems and necessary for the simplifying the equations of conservation of mass momentum and energy in fluid mechanics and understands the consequences of these simplifications and classification of non-Newtonian fluids.

2. The student knows the basic laws and equations of compressible fluid flows.

3. The student knows the concept of fluid momentum-flux and understands the equations describing the operation of water and wind turbines.

4. The student knows the causes of water hammer and is able to limit their effects.

5. The student knows and understands the origin and structure of differential equations expressing conservation of mass, momentum and energy in fluid mechanics and the phenomenon of turbulence, and knows the mathematical basis of its modeling (computational fluid dynamics equations).

6. The student knows the phenomena responsible for the loss of energy in fluid flows, and has in-depth knowledge of the ways to reduce these losses.

7. The student knows foundations of computer fluid dynamics (CFD), is aware both of advantages and limitations of CFD methods, knows and understands the need to verify and validate the results of CFD calculations.

Skills:

1. Student is able to introduce simplification in differential equations describing complex fluid flows and predict consequences of the simplifications.

2. Student can calculate theoretically flow characteristics of complex engineering systems both for incompressible and compressible fluids.

3. The student is able to determine the critical parameters of the compressible fluid - density, pressure and temperature.

4. The student is able to calculate the parameters of the fluid during the water hammer - pressure jump, speed of the pressure wave.

5. Student is able to determine by means of experimental methods the flow characteristics of pumps, fans, control valves and fittings.

6. The student has the ability to examine using PIV technique the structures of complex fluid flows.

7. The student is able to determine experimentally the flow characteristics of complex engineering systems.

Social competences:

1. The student understands the need for teamwork in solving theoretical and practical problems.

2. The student is aware of the need to evaluate the uncertainty of measurement and calculation results.

3. The student sees the need for systematic increasing his professional skills and competences.

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Lectures:

Final exam consists of two parts. Part 1: knowledge test (4 questions to answer), Part. 2: test of skills (2 problems to solve),

Continuous assessment of the students during lectures (rewarding activity of the students).

To pass each of the two parts of the exam (as well as to pass the tutorials) there is necessary to obtain at least 50% of the maximum points (max=20 points). The exam is passed if both part 1 and part 2 are passed. Corrected (Improved) is only this part which was failed.

Grading system:

0-9 points = 2,0 (failed)

10-12 points = 3,0 (sufficient)

13-14 points = 3,5 (sufficient plus)

15-16 points = 4,0 (good)

17-18 points = 4,5 (good plus)

19-20 points = 5,0 (very good)

Tutorials:

One short written test in the middle of semester and one written final test at the end of semester

Continuous assessment of the students (rewarding students activity).

Laboratory exercises

Assessment of prepared reports

Continuous assessment of the students during laboratory exercises

Programme content

The module program covers the following topics:

1. elements of gas dynamics,
2. design of turbomachinery blade systems,
3. powers and efficiencies of fans, pumps, blowers and compressors,
4. power and efficiency of water and wind turbines,
5. water hammer phenomenon,
6. basic fluid mechanics equations in differential notation,
7. introduction to the mathematical description of turbulent flow,
8. elements of computational fluid dynamics (CFD).

Course topics

The lecture program covers the following topics:

1. high-velocity gas flows; adiabatic gas flow in pipe with a constant cross-section; total, static and dynamic enthalpies, critical parameters of gas, Mach number,
2. the effect of neglecting gas compressibility on the accuracy of flow calculations,
3. kinematics of blade systems of turbomachinery; absolute, relative and lift velocities, velocity triangles.
4. power, performance and efficiency of turbomachinery in kinematic terms.
5. power of water and wind turbines,
6. water hammer phenomenon, basics of mathematical description; causes of occurrence and limiting the negative effects,
7. differential form of the mass conservation equation in fluid mechanics; general form of the equation; special cases of mass conservation equation,
8. differential form of the equations of momentum conservation in fluid mechanics; general form of equations, shear stress tensor, relationship between fluid pressure and normal stress components in the fluid; form of equations for Newtonian fluid and other special cases,
9. differential form of the energy conservation equation in fluid mechanics; general form of the equation, viscous dissipation problem; special cases,
10. turbulence; average velocity, velocity fluctuations, turbulence scale, turbulence intensity; turbulent stress, turbulent viscosity; turbulence kinetic energy; turbulence kinetic energy dissipation rate; selected turbulence models, CFD basics.

The tutorial program covers the following topics:

1. calculation of critical gas parameters,
2. comparison of calculation results taking into account and ignoring the compressibility of the flowing gas,
3. calculations of blade angles and blade profiles of selected turbomachines rotors,
4. calculation of the power of pumps, fans, blowers, compressors, water, wind and gas turbines,
5. calculation of the pressure jump and the velocity of movement of the pressure wave in the water hammer phenomenon,
6. calculation of forces occurring between the flowing fluid and the pipeline,
7. calculating the forces occurring between the fluid and the solid body it flows around,
8. sample solutions of simplified forms of differential equations describing mass, momentum and energy conservation laws.

The laboratories cover the following topics:

1. analysis (visualization) of the flow structure using the PIV and LDA techniques,
2. experimental analysis of the gas adiabatic expansion,
3. measurement of the fan flow characteristics,
4. measurement of the control valve flow characteristics.

Teaching methods

Classical lecture with elements of conversation

Tutorials: solving problems

Laboratory exercises: teaching by experimentation

It is required to familiarise yourself with the professional literature on the issues raised in a given exercise and to relate your own results to the literature you have read.

Breakdown of average student's workload

	Hours	ECTS
Total workload	100	4,00
Classes requiring direct contact with the teacher	60	2,50
Student's own work (literature studies, preparation for laboratory classes/ tutorials, preparation for tests/exam, project preparation)	40	1,50
