

COURSE DESCRIPTION CARD - SYLLABUS

Course name

Applied rheology [S2TCh2E-KiN>RS]

Course

Field of study

Chemical Technology

Year/Semester

1/1

Area of study (specialization)

Composites and Nanomaterials

Profile of study

general academic

Level of study

second-cycle

Course offered in

English

Form of study

full-time

Requirements

compulsory

Number of hours

Lecture

15

Laboratory classes

30

Other

0

Tutorials

0

Projects/seminars

0

Number of credit points

3,00

Coordinators

dr hab. inż. Szymon Woziwodzki prof. PP
szymon.woziwodzki@put.poznan.pl

Lecturers

Prerequisites

The student knows: basis of mathematical analysis, basis of chemistry and physics The student has the skills: the use of spreadsheets, statistical analysis of measurement results, principles of technical drawings The student knows the limitations of his knowledge and foresees the need for the dredging.

Course objective

Getting students with the basic knowledge of technical rheology, in particular with properties of non-Newtonian fluids and their microstructure, rheometry and methods of calculation of pressure loss. Development of ability of perform rheological study and practical use of the results obtained from experiment

Course-related learning outcomes

Knowledge:

1. Student knows the basic concepts of rheology: dynamic, kinematic and extensional viscosity, flow and viscosity curves, Deborah number, classification of fluids - [K_W11]
2. Student knows the basic rheological properties of time-independent and time dependent fluids, viscoelastic fluids, magneto- and electrorheological fluids and methods of their mathematical

description. - [K_W11]

3. Student knows the theoretical basis of capillary and rotational rheometry, measurement methods of viscoelastic properties of fluid and extensional viscosity, advantages and disadvantages of the different measurement methods and principles of their selection. - [K_W11]

4. Student knows the basic rheological properties of polymeric fluids, two-phase systems, and biomaterials used in the chemical industry. - [K_W09]

5. Student knows the methods of calculating the pressure loss for different classes of non-Newtonian fluids in pipelines and columns. - [K_W11, K_W15]

Skills:

1. Student is able to select an appropriate measurement method for determining the rheological properties of the various fluids - [K_U08; K_U18]

2. Student can perform rheological measurements using different methods. - [K_U08; K_U12]

3. Student is able to distinguish, based on the experimental studies, the rheological properties of various non-Newtonian fluids and to use appropriate mathematical rheological models to describe the flow curves - [K_U08]

4. Student is able to find relation between rheological properties of fluid and their application. - [K_U07]

Social competences:

1. The student understands the need to broaden their knowledge and skills due to the rapid advances in the chemical industry. He is aware that continuous training is a way to remain competitive in the labor market. - [K_K01]

2. The student can independently and as a team perform various tasks. He is aware of the responsibility for their implementation within the team. - [K_K04]

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

The knowledge acquired as the lecture is verified by the test in the form of a multiple-choice test carried out on the penultimate lecture. The exam consists of 15-20 questions (closed) and the threshold is 50% of the points. Test could be performed in stationary or remote mode. Regardless of the mode rules are the same.

The knowledge acquired within the laboratory is verified by three colloquium in form of the test. In addition, the verification is carried out by student-prepared laboratory exercise reports. Student will obtain positive grade when: all exercises are performed, all reports are accepted and student received positive grades from all tests. In the case of remote laboratories, students are required to read the materials regarding the performance of exercises, prepare reports based on the data provided by the supervisor and pass all tests in remote mode using eKursy platform.

Programme content

Issues in the field of technical rheology, in particular with properties of non-Newtonian fluids and their microstructure, rheometry and methods of calculation of pressure loss.

Course topics

Elastic, viscous and viscoelastic response; Time as a parameter characterizing the substance response; Simple shear of solids and fluids; Effect of temperature and pressure on the rheological properties of fluids; Non-Newtonian fluids: definition, concept of generalized Newtonian fluid, division; Mathematical rheological models of rheostable fluids; Fluids from the flow limit (the reasons for the method of determining the flow limit); Normal stress effects (Weissenberg effect, Barus effect); Mechanical models of liquid (Maxwell, Kelvin); Electro- and magnetological liquids; Viscosimetric flows; viscosimeters; Capillary rheometry of the basic rheometry equation - basic equations

Teaching methods

Multimedia presentation, presentation illustrated with examples on the table, and resolving tasks provided by the lecturer in stationary or remote mode; laboratory classes in stationary or remote mode

Breakdown of average student's workload

	Hours	ECTS
Total workload	75	3,00
Classes requiring direct contact with the teacher	45	2,00
Student's own work (literature studies, preparation for laboratory classes/ tutorials, preparation for tests/exam, project preparation)	30	1,00
