

COURSE DESCRIPTION CARD - SYLLABUS

Course name

Data acquisition and analysis [N2ZiIP2>AAD2]

Course

Field of study

Management and Production Engineering

Year/Semester

1/2

Area of study (specialization)

–

Profile of study

general academic

Level of study

second-cycle

Course offered in

Polish

Form of study

part-time

Requirements

compulsory

Number of hours

Lecture

8

Laboratory classes

0

Other

0

Tutorials

0

Projects/seminars

8

Number of credit points

3,00

Coordinators

Lecturers

Prerequisites

Basic knowledge of mathematics. Basics of using Windows and Office. Ability to think logically and independently obtain information from various sources, as well as understanding the need to learn

Course objective

The aim of the course is to provide students with knowledge and to develop practical skills in the acquisition, processing, analysis, and interpretation of data using selected IT tools, in particular MS Excel and Minitab software packages.

Course-related learning outcomes

Knowledge:

Student has theoretically based, detailed knowledge about assessing the efficiency of production processes and the effectiveness of an enterprise's functioning

Student has theoretically grounded knowledge of assessing the quality of products and production processes

Students know the basics and assumptions of decision support systems, including risk assessment

Student has detailed knowledge of measurement systems used in production systems

Skills:

Student is able to notice and identify problems occurring in systems and production processes and select and use methods and tools appropriate to solve them

Student is able to develop an experiment plan and determine the strength and significance of the impact of production process factors on its effectiveness and efficiency

Student is able to use experimental, data analysis and simulation methods to support decisions in various areas of enterprise operation

Social competences:

Student is aware of the need to critically analyze and evaluate their ideas and actions

Student understands the need to make changes in production processes and in the company.

Student understands the need for continuous learning; can inspire and organize the learning process of team members

Student is able to think and act in a creative and entrepreneurial way

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Lecture: passing the lecture content. Completion of the lecture in writing may take the form of solving tasks/problems, multiple choice tests, or more or less extensive written answers to the questions asked.

Passing the lecture if obtaining at least 50.1% correct answers. Assignment of grades to percentage ranges of results: <90–100> very good; <80–90) good plus; <70–80) good; <60–70) satisfactory plus; <50–60) satisfactory; <0–50) unsatisfactory.

Project: a report containing an analysis of the planned and performed experiment.

Programme content

Introduction to Statistical Inference.

Experimental Design Methods - Design of Experiment.

Techniques for Analyzing Results of Experiments.

Course topics

Lecture: 15-hour module

Introduction to statistical inference. Simple comparative experiments. The idea of designing experiments and the approach to experimentation. Basic terminology of design of experiments (DoE) methods. Division of DoE methods. Factorial designs. Taguchi's plans. Analysis of experiment results - analysis of variance. Analysis of experiment results - methods of presenting the results and their analysis. Full factorial designs. Fractional plans. Elimination plans - Plackett-Burman. Response surface plans.

Project: 15-hour module

Development of a statistical model for the process indicated by the lecturer based on an experiment planned and performed by the student in accordance with the Design of Experiments methodology. The analysis of the experiment results will be carried out using the miniTab software.

Teaching methods

Lecture: lecture illustrated with a multimedia presentation containing the discussed program content.

Project: team work under the supervision of the instructor.

Bibliography

Basic:

Breakdown of average student's workload

	Hours	ECTS
Total workload	75	3,00
Classes requiring direct contact with the teacher	16	0,50
Student's own work (literature studies, preparation for laboratory classes/ tutorials, preparation for tests/exam, project preparation)	59	2,50
